R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information:

None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-032 standards and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P8) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P8) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P8) in Table 1. OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4.	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for one of the categories (P1 through P8) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for two of the categories (P1 through P8) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P8) in Table 1. OR

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to "0.1"	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote 'b' pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC	

Version	Date	Action	Change Tracking
		has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote ‘b’ in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability (P0 through P8 events): a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only (P0 through P7 events only)**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only (P1 through P7 events only):** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed

<tr><th colspan="2">Table 1 – Steady State & Stability Performance Extreme Events</th></tr>
<tr><td colspan="2">Steady State & Stability
For all extreme events evaluated:
a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
b. Simulate Normal Clearing unless otherwise specified.</td></tr>
<tr><td>Steady State
1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
a. Loss of a tower line with three or more circuits.[11]
b. Loss of all Transmission lines on a common Right-of-Way[11].
c. Loss of a switching station or substation (loss of one voltage level plus transformers).
d. Loss of all generating units at a generating station.
e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
a. Loss of two generating stations resulting from conditions such as:
i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.</td>
<td>Stability
1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
a. 3Ø fault on generator with stuck breaker[10] resulting in Delayed Fault Clearing.
b. 3Ø fault on Transmission circuit with stuck breaker[10] resulting in Delayed Fault Clearing.
c. 3Ø fault on transformer with stuck breaker[10] resulting in Delayed Fault Clearing.
d. 3Ø fault on bus section with stuck breaker[10] resulting in Delayed Fault Clearing.
e. 3Ø internal breaker fault.
f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances</td></tr>
</table>

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. 11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less. 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction. 13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows: a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing, which is not monitored or not reported at a Control Center; c. A single station dc supply associated with protective functions required for Normal Clearing, and that single station dc supply is not monitored or not reported at a Control Center for both low voltage and open circuit; d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
    a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

<u>III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required</u>

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the first draft of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 29, 2015
SAR posted for comment	May 26 – June 24, 2016
Informal Comment Period	April 25 – May 24, 2017
45-day formal comment period with initial ballot	September 8 – October 23, 2017

Anticipated Actions	Date
45-day formal comment period with additional ballot	February 2018
10-day final ballot	May 2018
Board adoption	August 2018

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-~~4~~5**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

~~**5. Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

~~Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

~~For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-4, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-4:~~

- ~~P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P2-1~~
- ~~P2-2 (above 300 kV)~~
- ~~P2-3 (above 300 kV)~~
- ~~P3-1 through P3-5~~

- ~~P4-1 through P4-5 (above 300 kV)~~
- ~~P5 (above 300 kV)~~

~~**B. Requirements**~~

5. Effective Date: See Implementation Plan.

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-~~010 and MOD-012 standards~~032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

1.1.2. Known outage(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1. Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with ~~a~~ the selected known outage(s); and

~~**1.1.1.1.**~~**1.1.2.2.** Does not exclude known outage(s) solely based upon the outage duration~~ of at least six months. ~~.

~~**1.1.2.**~~**1.1.3.** New planned Facilities and changes to existing Facilities.

~~**1.1.3.**~~**1.1.4.** Real and reactive Load forecasts.

~~**1.1.4.**~~**1.1.5.** Known commitments for Firm Transmission Service and Interchange.

~~**1.1.5.**~~**1.1.6.** Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-032 including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be ~~studied~~assessed. The ~~studies~~analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

~~**2.4.3.**~~**2.4.4.** For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.

- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

~~2.4.4.~~**2.4.5.** When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or ~~Special Protection Systems~~ Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

~~**M1.**~~**M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a ~~Special Protection System~~Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an

evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated ~~-~~in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.~~. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.~~

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

~~M2.~~M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information:

None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the ~~MOD-010 and~~ MOD-~~012~~032 standards and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P~~7~~8) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P~~7~~8) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P~~7~~8) in Table 1. OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4.	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for one of the categories (P1 through P~~7~~8) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for two of the categories (P1 through P~~7~~8) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P~~7~~8) in Table 1. OR

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to "0.1"	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote 'b' pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC	

Version	Date	Action	Change Tracking
		has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote 'b' in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability~~:~~ (P0 through P8 events): a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.
Steady State Only~~:~~ (P0 through P7 events only): f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.
Stability Only~~:~~ (P1 through P7 events only): j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault [8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) [8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker [10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus ~~relay~~non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant ~~relay[13]~~component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device [6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes
P8 Multiple Contingency *(Fault plus non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	3Ø	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
   a. Loss of a tower line with three or more circuits.[11]
   b. Loss of all Transmission lines on a common Right-of-Way[11].
   c. Loss of a switching station or substation (loss of one voltage level plus transformers).
   d. Loss of all generating units at a generating station.
   e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
   a. Loss of two generating stations resulting from conditions such as:
      i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
   a. 3Ø fault on generator with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   b. 3Ø fault on Transmission circuit with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   c. 3Ø fault on transformer with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   d. 3Ø fault on bus section with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   e. 3Ø internal breaker fault.
   f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss. 2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria. 3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss. 4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service. 5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. 6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground. 7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point. 8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker. 9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. ~~Applies~~For purposes of this standard, non-redundant components of a Protection System to ~~the following~~consider are as follows: a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing, which is not monitored or not reported at a Control Center; c. A single station dc supply associated with protective functions ~~or types: pilot (#85), distance (#21), differential (#87), current (#50, 51~~required for Normal Clearing, and ~~67),~~that single station dc supply is not monitored or not reported at a Control Center for both low voltage ~~(#27 & 59), directional (#32, & 67),~~ and ~~tripping (#86, & 94).~~open circuit; d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level

   b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
   a. The estimated number and type of customers affected
   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

~~C. Measures~~

~~**M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.~~

~~**M4.M1.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.~~

~~**M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.~~

~~**M6.M1.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.~~

~~**M7.M1.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.~~

~~**M8.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.~~

~~**M9.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.~~

~~**M10.M1.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.~~

~~D. Compliance~~

~~**1. Compliance Monitoring Process**~~

~~**1.1 Compliance Enforcement Authority**~~

~~Regional Entity~~

~~**1.2 Compliance Monitoring Period and Reset Timeframe**~~

~~Not applicable.~~

~~1.3 Compliance Monitoring and Enforcement Processes:~~

- ~~Compliance Audits~~
- ~~Self-Certifications~~

~~Spot Checking~~

- ~~Compliance Violation Investigations~~

~~Self-Reporting~~

- ~~Complaints~~

~~1.4 Data Retention~~

~~The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

- ~~The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.~~

~~The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.~~

- ~~The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.~~
- ~~The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.~~
- ~~The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.~~
- ~~The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.~~
- ~~The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.~~

~~The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

- ~~Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.~~

~~If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.~~

~~1.5 Additional Compliance Information~~

~~None~~

2. ~~Violation Severity Levels~~

	~~Lower VSL~~	~~Moderate VSL~~	~~High VSL~~	~~Severe VSL~~
~~R1~~	~~The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.~~	~~The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.~~	~~The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.~~	~~The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6.~~ ~~OR~~ ~~The responsible entity's System model did not represent projected System conditions as described in Requirement R1.~~ ~~OR~~ ~~The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.~~
~~R2~~	~~The responsible entity failed to comply with Requirement R2, Part 2.6.~~	~~The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.~~	~~The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.~~	~~The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7.~~ ~~OR~~ ~~The responsible entity does not have a completed annual Planning Assessment.~~
~~R3~~	~~The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.~~	~~The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.~~	~~The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of~~	~~The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.~~

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the first draft of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	October 29, 2015
SAR posted for comment	May 26 – June 24, 2016
Informal Comment Period	April 25 – May 24, 2017
45-day formal comment period with initial ballot	September 8 – October 23, 2017

Anticipated Actions	Date
45-day formal comment period with additional ballot	February 2018
10-day final ballot	May 2018
Board adoption	August 2018

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-5**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

1.1.2. Known outage(s) of generation or Transmission Facility(ies) scheduled in ~~as selected in consultation with the Reliability Coordinator for~~ the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1. ~~for analyses pursuant to Requirement R2, parts 2.1.3 and 2.4.3~~Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with the selected known outage(s); and

1.1.2.2. Does not exclude known outage(s) solely based upon the outage duration.

~~1.1.2.~~1.1.3. New planned Facilities and changes to existing Facilities.

~~1.1.3.~~1.1.4. Real and reactive Load forecasts.

~~1.1.4.~~1.1.5. Known commitments for Firm Transmission Service and Interchange.

~~1.1.5.~~1.1.6. Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-032 including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.

- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. The analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

2.4.4. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

~~**4.2.1.** If the analysis concludes there is Cascading caused by the occurrence of extreme events, excluding extreme events 2e-2h in the stability column, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.~~

~~**4.2.2.** If the analysis concludes there is Cascading caused by the occurrence of extreme events 2e-2h in the stability column, an evaluation of possible actions designed to prevent the System from Cascading shall:~~

~~**4.2.2.1.** List System deficiencies, the associated actions needed to prevent the System from Cascading, and the associated timetable for implementation.~~

~~**4.2.2.2.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.~~

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information~~. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.~~

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

   1.2. **Evidence Retention:** The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit

   The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

   1.3. **Compliance Monitoring and Enforcement Program** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

   1.4. **Compliance Monitoring Period and Reset Timeframe:**

   Not applicable.

   1.5. **Compliance Monitoring and Enforcement Processes:**

   - Compliance Audits
   - Self-Certifications
   - Spot Checks
   - Compliance Violation Investigations
   - Self-Report
   - Complaints

   1.6. **Additional Compliance Information:**

   None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-032 standards and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P8~~7~~) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P8~~7~~) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P8~~7~~) in Table 1. OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4.	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5. Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to “0.1”	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC	

Version	Date	Action	Change Tracking
		has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote ‘b’ in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability (P0 through P8 events): a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only (P0 through P7 events only)**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only (P1 through P7 events only):** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

P8 Multiple Contingency *(Fault plus non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer [5] 4. Shunt Device [6] 5. Bus Section	3Ø	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events	
Steady State & Stability For all extreme events evaluated: a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency. b. Simulate Normal Clearing unless otherwise specified.	
Steady State 1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments. 2. Local area events affecting the Transmission System such as: a. Loss of a tower line with three or more circuits.[11] b. Loss of all Transmission lines on a common Right-of-Way[11]. c. Loss of a switching station or substation (loss of one voltage level plus transformers). d. Loss of all generating units at a generating station. e. Loss of a large Load or major Load center. 3. Wide area events affecting the Transmission System based on System topology such as: a. Loss of two generating stations resulting from conditions such as: i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.	**Stability** 1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments. 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker[10] resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker[10] resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker[10] resulting in Delayed Fault Clearing. ~~d.~~ 3Ø fault on bus section with stuck breaker[10] resulting in Delayed Fault Clearing. ~~3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.~~ ~~e. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.~~

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	~~f. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.~~ ~~g.~~d. ~~3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Cleari~~ ~~h.~~e. 3Ø internal breaker fault. ~~i.~~f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. 11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less. 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction. 13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows: a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times~~, e.g. sudden pressure relaying~~; b. A single communications system, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing, which is not monitored or not reported at a Control Center; c. A single station dc supply associated with protective functions required for Normal Clearing, and that single station dc supply is not monitored or not reported at a Control Center for both low voltage and open circuit; d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing.

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
    a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

Implementation Plan

Project 2015-10 Single Points of Failure
Reliability Standard TPL-001-5

Applicable Standard(s)

- TPL-001-5 – Transmission System Planning Performance Requirements

Requested Retirement(s)

- TPL-001-4 – Transmission System Planning Performance Requirements

Prerequisite Standard(s)

- None

Applicable Entities

- Planning Coordinator
- Transmission Planner

Background

Reliability Standard TPL-001-5 revises the prior version of the TPL-001 standard in three key respects:

- To address reliability issues concerning the study of single points of failure on Protection Systems, as identified in Federal Energy Regulatory Commission (FERC) Order No. 754 issued September 15, 2011, and the NERC Planning Committee System Protection and Control Subcommittee and System Analysis and Modeling Subcommittee September 2015 report titled *Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request;*
- To address directives from FERC Order No. 786 issued October 17, 2013, in which FERC approved Reliability Standard TPL-001-4, relating to:
    - modeling known outages with a duration of less than six months; and
    - adding stability analysis for the outage of major Transmission Equipment with a lead time of one year or more.
- To replace references to the MOD-010 and MOD-012 standards, which have been superseded by the MOD-032 Reliability Standard.

General Considerations

This implementation plan provides 36 months until the effective date of the Standard, providing Planning Coordinators and Transmission Planners with time to update their annual Planning

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Implementation Plan

Project 2015-10 Single Points of Failure

Reliability Standard TPL-001-5

Applicable Standard(s)

- TPL-001-5 – Transmission System Planning Performance Requirements

Requested Retirement(s)

- TPL-001-4 – Transmission System Planning Performance Requirements

Prerequisite Standard(s)

- None

Applicable Entities

- Planning Coordinator
- Transmission Planner

Background

Reliability Standard TPL-001-5 revises the prior version of the TPL-001 standard in three key respects:

- To address reliability issues concerning the study of single points of failure on Protection Systems, as identified in Federal Energy Regulatory Commission (FERC) Order No. 754 issued September 15, 2011, and the NERC Planning Committee System Protection and Control Subcommittee and System Analysis and Modeling Subcommittee September 2015 report titled *Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request;*
- To address directives from FERC Order No. 786 issued October 17, 2013, in which FERC approved Reliability Standard TPL-001-4~~; and~~, relating to:
    - modeling known outages with a duration of less than six months; and
    - adding stability analysis for the outage of major Transmission Equipment with a lead time of one year or more.
- To replace references to the MOD-010 and MOD-012 standards, which have been superseded by the MOD-032 Reliability Standard.

General Considerations

~~The 36-month~~This implementation ~~period for TPL-001-5~~plan provides 36 months until the effective date of the Standard, providing Planning Coordinators and Transmission Planners with time to update their annual Planning Assessments to include the new System models and studies required by the standard. This implementation period reflects consideration that Planning Coordinators and Transmission Planners will need time to develop, among other things:

- A ~~process~~procedure or technical rationale for ~~coordinating with the Reliability Coordinator which~~selecting known outages of generation ~~of~~and Transmission Facilities ~~of less than six months shall be represented in planning studies~~;
- A process for establishing coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis required by the standard; and
- Additional base case models and analysis.

In addition, ~~the~~this implementation plan includes an additional 24-month period for the development of Corrective Action Plans (CAPs) under TPL-001-5 to address newly-added studies for P5 and P8 planning events involving single points of failure on Protection Systems.

This extended implementation period for the part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1", acknowledges that failures to meet System performance requirements, identified during subsequent Planning Assessment(s), for single points of failure in Protection Systems may not be mitigated by an Operating Procedure during an interim period before a mitigating capital improvement is installed.

This implementation period reflects consideration that Planning Coordinators and Transmission Planners will need time beyond that provided to conduct the new studies and analysis to develop processes for coordination with asset owners and protection engineers to identify appropriate ~~Corrective Action Plan~~CAP actions and establish the associated timetables for completion. This includes~~:~~

- ~~Any~~ any necessary ~~Corrective Action Plans to address Cascading caused by the occurrence of Table 1 extreme events listed in the stability column for events 2e-2h required by TPL-001-5 Requirement R4 Part 4.6; and~~

~~Any necessary Corrective Action Plans~~CAP to address System performance issues for studies involving Table 1 Category P5 and P8 Multiple Contingency (Fault plus non-redundant component of a Protection System failure to operate) required by TPL-001-5 Requirement R2, Part 2.7 for the ~~following~~ non-redundant components of a Protection System identified in TPL-001-5 Table 1 Footnote 13~~, items 2-4:~~.

  - ~~A single communications system, necessary for correct operation of protective functions, which is not monitored or not reported~~

- ~~A single dc supply associated with protective functions, and that single station dc supply is not monitored or not reported for both low voltage and open circuit~~
- ~~A single control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.~~

Lastly, the provisions related to ~~Corrective Action Plans~~CAP including Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3) are carried forward from the TPL-001-4 implementation plan.

Effective Date

TPL-001-5 – Transmission System Planning Performance Requirements

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for TPL-001-5 Requirement ~~R4, Part 4.6 and Requirement~~ 2, Part 2.7 associated with Table 1 Category P5 Footnote 13 items ~~2, 3,~~b, c, and d and 4P8

~~Entities shall not be required to comply with Requirement R4, Part 4.6 until 24 months after the effective date of Reliability Standard TPL-001-5.~~

Entitles shall not be required to comply with Requirement R2, Part 2.7 for the Table 1 Category P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items ~~2, 3~~b, c, and 4d or P8 until 24 months after the effective date of Reliability Standard TPL-001-5.

~~**Note Regarding Corrective Action Plans**~~

For CAPs developed to address failures to meet Table 1 performance requirements for P5 or P8 events only, Transmission Planners and Planning Coordinators shall not be required to comply with the section of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1**", until 96 months after the effective date of Reliability Standard TPL-001-5.

Note Regarding CAPs

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval of TPL-001-4, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, ~~Corrective Action Plans~~CAP applying to the following categories of Contingencies and events identified in TPL-001-5, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-5:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

Initial Performance of Periodic Requirements

Each responsible entity shall complete the first annual Planning Assessment without CAPs for revised P5 or P8 in accordance with TPL-001-5 by the effective date of the standard.

Each responsible entity shall ~~complete~~develop any required ~~Corrective Action Plans~~CAP under ~~Requirement R4, Part 4.6 and~~ Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13 items ~~2, 3~~b, c, and ~~4~~d and P8 by 24 months after the effective date of Reliability Standard TPL-001-5.

Retirement Date

TPL-001-4 – Transmission System Planning Performance Requirements

Reliability Standard TPL-001-4 shall be retired immediately prior to the effective date of TPL-001-5 in the particular jurisdiction in which the revised standard is becoming effective.

Assessments to include the new System models and studies required by the standard. This implementation period reflects consideration that Planning Coordinators and Transmission Planners will need time to develop, among other things:

- A procedure or technical rationale for selecting known outages of generation and Transmission Facilities;
- A process for establishing coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis required by the standard; and
- Additional base case models and analysis.

In addition, this implementation plan includes an additional 24-month period for the development of Corrective Action Plans (CAPs) under TPL-001-5 to address newly-added studies for P5 and P8 planning events involving single points of failure on Protection Systems.

This extended implementation period for the part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1", acknowledges that failures to meet System performance requirements, identified during subsequent Planning Assessment(s), for single points of failure in Protection Systems may not be mitigated by an Operating Procedure during an interim period before a mitigating capital improvement is installed.

This implementation period reflects consideration that Planning Coordinators and Transmission Planners will need time beyond that provided to conduct the new studies and analysis to develop processes for coordination with asset owners and protection engineers to identify appropriate CAP actions and establish the associated timetables for completion. This includes any necessary CAP to address System performance issues for studies involving Table 1 Category P5 and P8 Multiple Contingency (Fault plus non-redundant component of a Protection System failure to operate) required by TPL-001-5 Requirement R2, Part 2.7 for the non-redundant components of a Protection System identified in TPL-001-5 Table 1 Footnote 13.

Lastly, the provisions related to CAP including Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3) are carried forward from the TPL-001-4 implementation plan.

Effective Date

TPL-001-5 – Transmission System Planning Performance Requirements

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for TPL-001-5 Requirement 2, Part 2.7 associated with Table 1 Category P5 Footnote 13 items b, c, and d and P8

Entitles shall not be required to comply with Requirement R2, Part 2.7 for the Table 1 Category P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items b, c, and d or P8 until 24 months after the effective date of Reliability Standard TPL-001-5.

For CAPs developed to address failures to meet Table 1 performance requirements for P5 or P8 events only, Transmission Planners and Planning Coordinators shall not be required to comply with the section of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1**", until 96 months after the effective date of Reliability Standard TPL-001-5.

Note Regarding CAPs

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval of TPL-001-4, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, CAP applying to the following categories of Contingencies and events identified in TPL-001-5, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-5:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

Initial Performance of Periodic Requirements

Each responsible entity shall complete the first annual Planning Assessment without CAPs for revised P5 or P8 in accordance with TPL-001-5 by the effective date of the standard.

Each responsible entity shall develop any required CAP under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13 items b, c, and d and P8 by 24 months after the effective date of Reliability Standard TPL-001-5.

Retirement Date

TPL-001-4 – Transmission System Planning Performance Requirements

Reliability Standard TPL-001-4 shall be retired immediately prior to the effective date of TPL-001-5 in the particular jurisdiction in which the revised standard is becoming effective.

Unofficial Comment Form

Project 2015-10 Single Points of Failure TPL-001

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2015-10 TPL-001-5 – Transmission System Planning Performance Requirements**. Comments must be submitted by **8 p.m. Eastern, Monday, April 23, 2018.**

Additional information is available on the project page. If you have questions, contact Standards Developer, Latrice Harkness (via email), or at (404) 446-9728.

Background Information

The SPCS and the SAMS conducted an assessment of protection system single points of failure in response to FERC Order No. 754, including analysis of data from the NERC Section 1600 Request for Data or Information. The assessment confirms the existence of a reliability risk associated with single points of failure in protection systems that warrants further action**.**

Additionally, the two directives from FERC Order No. 786 (p. 40 and p. 89) and updates to the MOD reference in Requirement R1, Measure M1 and the Violation Severity Levels sections have been added to the scope of the project.

Questions

1. Do you agree with the creation of the proposed P8 event?

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree with the changes to TPL-001-4 Requirement 1, Part 1.1.2, in order to meet the FERC directive in Order No. 786?

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree with the proposed implementation plan?

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the proposed revisions to TPL-001-4?

   ☐ Yes
   ☐ No

   Comments:

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754?

   ☐ Yes
   ☐ No

   Comments:

Violation Risk Factor and Violation Severity Level Justifications

Project 2015-10 Single Points of Failure TPL-001

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for Requirement R4 in Project 2015-10 and Single Points of Failure TPL-001. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification for TPL-001-5, Requirement R1

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R1

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R2

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R2

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R3

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R3

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R4

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R4

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R5
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R5
The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R6
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R6
The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R7
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R7
The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R8
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R8
The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

Mapping Document

Project 2015-10 Single Points of Failure TPL-001

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
TPL-001-4, Requirement R1 **R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. **1.1** System models shall represent: **1.1.1.** Existing Facilities	TPL-001-5, Requirement R1 **R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]* **1.1.** System models shall represent: **1.1.1.** Existing Facilities.	<u>Requirement R1 body</u>. Updated referenced standard number in body of requirement. <u>Requirement R1 Part 1.1.2</u> Consistent with FERC Order 786 Para 40, the six-month threshold that could exclude planned maintenance outages is eliminated. Additionally, the addition of Near-term Planning Horizon aligns this requirement with IRO-017-1 Requirement R4 which requires the Planning Coordinator and Transmission Planner to jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months. **1.1.3.** New planned Facilities and changes to existing Facilities **1.1.4.** Real and reactive Load forecasts **1.1.5.** Known commitments for Firm Transmission Service and Interchange **1.1.6.** Resources (supply or demand side) required for Load	1.1.2. Known -outage(s) of generation or Transmission Facility(ies) scheduled in ~~as selected in consultation with the Reliability Coordinator for~~ the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum: ~~1.1.2.1.~~ ~~for analyses pursuant to Requirement R2, parts 2.1.3 and 2.4.3~~Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events	Assessment for the Near-Term Transmission Planning Horizon. Requirement R1 Parts 1.1.2.1, 1.1.2.2, and 1.1.2.3 Substantial regional differences exist for outage coordination methods and procedures, making it difficult to define specific known outage selection criteria pertinent to all. Therefore, considering the NERC SAMS recommendations, selection of known outages in the Near-Term Planning Horizon were limited to three primary considerations. Requirement R1 Part 1.1.2.1 A properly planned Transmission system should facilitate maintenance outages without Non-Consequential Load Loss (FERC Order 786, Paragraph 41).

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	in Table 1 when concurrent with the selected known outage(s); and ~~1.1.2.2.~~ Does not exclude known outage(s) solely based upon the outage duration. ~~1.1.2.~~1.1.3. New planned Facilities and changes to existing Facilities. ~~1.1.3.~~1.1.4. Real and reactive Load forecasts. ~~1.1.4.~~1.1.5. Known commitments for Firm Transmission Service and Interchange. ~~1.1.5.~~1.1.6. Resources (supply or demand side) required for Load.	Therefore, System models shall represent known outages in the Near-Term Transmission Planning Horizon that are expected to result in Non-Consequential Load Loss following a Table 1 P1 Event. It is noted that the performance requirements for all Table 1 Events include that the System shall remain stable, as well as Cascading and uncontrolled islanding shall not occur. Requirement R1 Part 1.1.2.2 Planned outages lasting less than six months could be overlooked when the Transmission Planner and Planning Coordinator formulate System models (FERC Order 786, Paragraph 42). Further, there is no correlation between the System impact of an outage and its duration. Therefore, while duration is an

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
		acceptable factor to consider when selecting a known outage for representation in System models, the duration shall not be the sole factor for omission. <u>Requirement R1 Part 1.1.2.3</u> A technical rationale is necessary to establish a rules-based approach to the selection of known outages for representation in System models. Similarly, regional operational approaches and outage coordination procedures vary, but the selection of known outages should incorporate input from operational experience. Therefore, known outages shall be selected according to an established procedure or a technical rationale.
TPL-001-4, Requirement R2	TPL-001-5, Requirement R2	No modifications made.

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
Parts 2.1, 2.1.1, 2.1.2, 2.1.4 and 2.1.5 Parts 2..2, 2.2.1 Part 2.3 Parts 2.4, 2.4.1, 2.4.2 Part 2.5 Parts 2.6, 2.6.1, 2.6.2 Parts 2.7, 2.7.1, 2.7.2, 2.7.3, 2.7.4 Parts 2.8, 2.8.1, 2.8.2	Parts 2.1, 2.1.1, 2.1.2, 2.1.4 and 2.1.5 Parts 2..2, 2.2.1 Part 2.3 Parts 2.4, 2.4.1, 2.4.2 Part 2.5 Parts 2.6, 2.6.1, 2.6.2 Parts 2.7, 2.7.1, 2.7.2, 2.7.3, 2.7.4 Parts 2.8, 2.8.1, 2.8.2	
TPL-001-4, Requirement R2 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.	TPL-001-5, Requirement R2 2.1.3. P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.	Requirement R2 Part 2.1.3 A properly planned Transmission system should facilitate maintenance outages without Non-Consequential Load Loss, maintain a stable System without Cascading and uncontrolled islanding. (FERC Order 786, Paragraph 41). Therefore, consistent with the principle of TPL-001-5 Requirement R3, Part 3.4 which requires the Transmission Planner and Planning Coordinator to identify those planning events in Table 1 that are

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
		expected to produce more severe System impacts on its portion of the BES, only those P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES are to be assessed for System models that include known outages pursuant to Requirement R1 Part 1.1.2.
TPL-001-4, Requirement R2 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance: • Load level, Load forecast, or dynamic Load model assumptions.	TPL-001-4, Requirement R2 2.4.4~~3~~. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance: • Load level, Load forecast, or dynamic Load model assumptions. • Expected transfers.	<u>TPL-001-5, Requirement R2, Part 2.4.4</u> TPL-001-4, Part 2.4.3 moved to TPL-001-5, Part 2.4.4

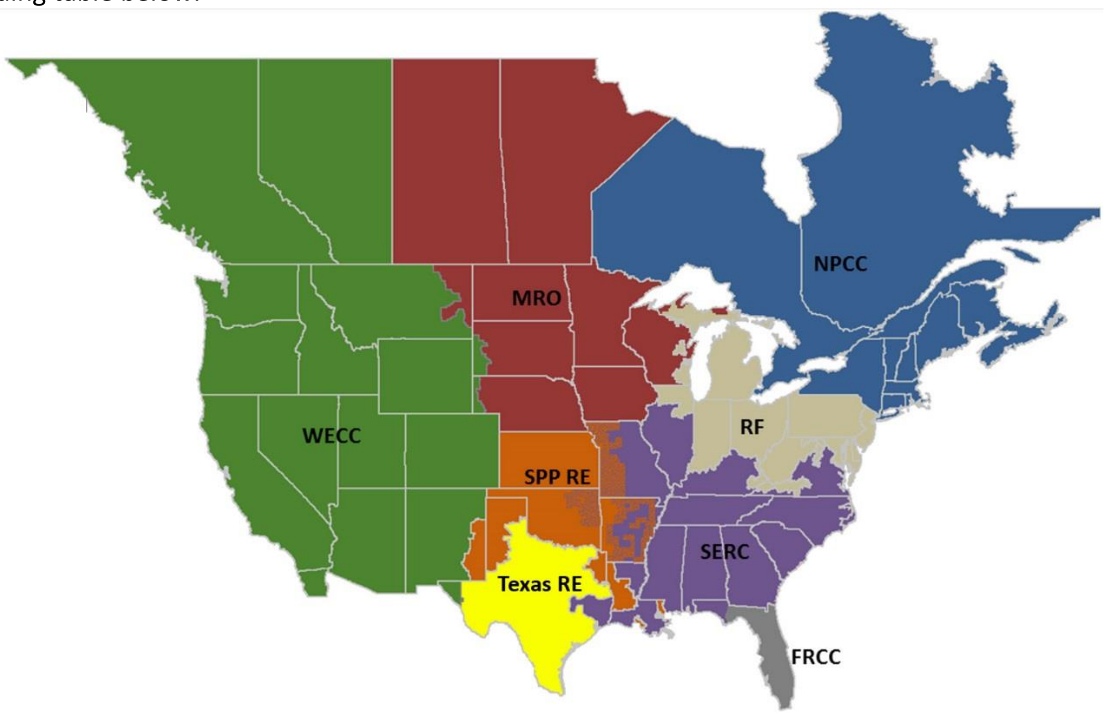
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to assure the reliability and security of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the Electric Reliability Organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into eight Regional Entity (RE) boundaries as shown in the map and corresponding table below.



The North American BPS is divided into eight RE boundaries. The highlighted areas denote overlap as some load-serving entities participate in one Region while associated transmission owners/operators participate in another.

FRCC	Florida Reliability Coordinating Council

RF	ReliabilityFirst
SERC	SERC Reliability Corporation
SPP RE	Southwest Power Pool Regional Entity
Texas RE	Texas Reliability Entity
WECC	Western Electricity Coordinating Council

Executive Summary

Project 2015-10 Technical Rationale provides the background and rationale for proposed revisions to Reliability Standard TPL-001-4. The proposed revisions address reliability issues concerning the study of single points of failure (SPF) on Protection Systems from FERC Order No. 754, directives from FERC Order No. 786 regarding planned maintenance outages and stability analysis for spare equipment strategy , and replaces references to the MOD-010 and MOD-012 standards with the MOD-032 Reliability Standard.

Key Concepts of FERC Order No. 754

The Standards Development Team (SDT) took into account the recommendations for modifying NERC Reliability Standard TPL-001-4 identified in both the SPCS and SAMS report titled *Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request* and the *Informational filing of the North American Electric Reliability Corporation in Response to Order No. 754* to the FERC. In "Table 1 – Steady State and Stability Performance Planning Events," breaker failure and failure of a non-redundant component of a Protection System are differentiated. The SDT recognizes that sequence and timing of Protection System action leading to Delayed Clearing may be quite different between the two causalities, and also that fault severity and acceptable consequence of failure of a non-redundant component of a Protection System should be differentiated. Proposed revisions to "Table 1 – Steady State and Stability Performance Planning Events", adds a new P8 Planning Event to include a 3-phase fault and failure of a non-redundant component of a Protection System. Footnote 13 of the "Table 1 – Steady State & Stability Performance Footnotes" describes the non-redundant Protection System components to be considered for Category P5 and the proposed new Category P8 Planning Events.

Key Concepts of FERC Order No. 786

The SDT considered the Commission's concern that the outages of significant facilities less than six months could be overlooked for planning purposes, Category P3 and P6 do not sufficiently cover planned maintenance outages, and Near-Term Transmission Planning Horizon requires annual assessments using Year One or year two, and year five, and known planned facility outages of less than six months should be addressed so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon. Proposed revisions remove the six month outage duration and replace it with the requirement to document an established procedure or the technical rationale, to determine which known outages to study.. Proposed revisions includes stability study for long lead equipment that does not have a spare.

Summary of proposed revisions:

- Requirement R1 – Updated for MOD-032-1 standard.
- Requirement R1, Part 1.1.2 – Modified how known outages are selected for study.
- Requirement R2, Part 2.1.3 – Added model conditions for steady state analysis of P1 events for known outages.
- Requirement R2, Part 2.4.3 – Added model conditions for stability analysis of P1 events for known outages.
- Requirement R2, Part 2.4.5 – Added stability analysis requirement for long lead time equipment unavailability.
- Requirement R4, Part 4.2 – Document internal conforming clean-up to incorporate the last sentence of Part 4.5.
- Table 1 – Modified Category P5 event to include SPF.
- Table 1 – Note the Steady State and Stability performance thresholds that are applicable to Category P1 through P7 events only and not to P8 events

- Table 1 – Added Category P8 event to include SPF following a 3-phase fault, with applicable performance thresholds
- Table 1 – Modified Footnote 13 to specify SPF.

Introduction

NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) is being modified to address reliability issues and standard modification directives contained in FERC Order No. 754[1] and FERC Order No. 786.[2] Proposed Reliability Standard TPL-001-5 revises the TPL-001 standard to address the reliability risks posed by SPF on Protection Systems.

Background

FERC Order No. 754

FERC Order No. 754 directed NERC to study the reliability risk associated with single points of failure (SPF) in Protection Systems. As a follow-up to a NERC Technical Conference where the risks and concerns associated with SPF were discussed, the NERC System Protection and Control Subcommittee (SPCS) and the System Analysis and Modelling Subcommittee (SAMS) conducted an assessment of Protection System SPF in response to FERC Order 754, including analysis of data collected pursuant to a request for data or information under Section 1600 of the NERC Rules of Procedure. The SPCS and SAMS report titled *Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request* and the *Informational filing of the North American Electric Reliability Corporation in Response to Order No. 754* to the FERC provide extensive general discussion about the reliability risks associated with a SPF. Available

FERC Order No. 786

In Order No. 786, FERC directed NERC to address two issues. The first issue is the concern that the six month outage duration threshold could exclude planned maintenance outages of significant facilities from future planning assessments. FERC directed NERC to modify TPL-001-4 to address this concern. The second issue involves adding clarity regarding dynamic assessment of outages of critical long lead time equipment, consistent with the entity's spare equipment strategy. FERC directed NERC to consider this issue upon its next review of TPL-001-4. The NERC SAMS developed a white paper documenting the technical analysis conducted by SAMS to address the two directives contained in the FERC Order 786. The white paper provides extensive general discussion regarding the directives.

Section 1: Single Points of Failure on Protection Systems (FERC Order No. 754)

NERC Advisory

On March 30, 2009, NERC issued an advisory[3] report notifying the industry that a SPF issue had caused three significant system disturbances in 5 years.

Transmission Owners, Generation Owners, and Distribution Providers owning Protection Systems installed on the Bulk Electric System were advised to address SPF on their Protection Systems when identified in routine system evaluations to prevent N-1 transmission system contingencies from evolving into more severe or even extreme events.

These entities were additionally advised to begin preparing an estimate of the resource commitment required to review, re-engineer, and develop a workable outage and construction schedule to address SPF on their Protection Systems.

FERC Order No. 754

In Order No. 754 Paragraph 20, FERC directed NERC to "to make an informational filing within six months of the date of the issuance of this Final Rule explaining whether there is a further system protection issue that needs to be addressed and, if so, what forum and process should be used to address that issue and what priority it should be accorded relative to other reliability initiatives planned by NERC."

FERC Technical Conference

A FERC technical conference concerning the Commission's Order 754 titled Staff Meeting on Single Points of Failure on Protection Systems was held on October 24-25, 2011 at FERC in Washington, DC.

At the Technical Conference, the attendees discussed the SPF issue and narrowed their concerns into four consensus points:

- The concern with assessment of SPF is a performance-based issue, not a full redundancy issue.
- The existing approved standards address assessments of SPF.
- Assessments of SPF of non-redundant primary protection (including backup) systems need to be sufficiently comprehensive.
- Lack of sufficiently comprehensive assessments of non-redundant primary Protection Systems is a reliability concern.

Joint SPCS-SAMS Report

One outcome of the FERC Technical Conference was that NERC would conduct a data collection effort to provide a broad factual foundation that could aid in assessing the reliability risks posed by SPF. The NERC Board of Trustees approved the request for data or information under Section 1600 of the NERC Rules of Procedure ("Order No. 754 Data Request") on August 16, 2012.

In September 2015, SPCS and SAMS issued a report to the NERC PC/OC, summarizing the information collected under the Order No. 754 Data Request. The assessment confirmed the existence of a reliability risk associated with SPF in Protection Systems that warrants further action. To address this risk, the SPCS and the SAMS

[3] *See* *Industry Advisory: Single Point of Failure*
http://www.nerc.com/files/Final_Order_754_Informational_Filing_3-15-12_complete.pdf

considered a variety of alternatives and concluded that the most appropriate recommendation that aligns with FERC Order 754 directives and maximizes reliability of Protection System performance is to modify NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) through the NERC standards development process.

The report recommendations, as well as how they have been addressed in proposed TPL-001-5 by the Project 2015-10 standard drafting team are summarized in the following section.

Revisions to TPL-001-4

Table 1-Footnote 13

The SPCS/SAMS report recommended replacing “relay” with “component of a Protection System” in the Table 1 P5 event and replace Footnote 13 in TPL-001-4 with the following alternate wording:

> The components from the definition of ’Protection System‘ for the purposes of this standard include (1) protective relays that respond to electrical quantities, (2) single station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), and (3) DC control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

Based on discussion and industry comment, the SDT proposes similar revisions to Footnote 13 to clarify the components of the Protection System that must be considered when simulating Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System. This consideration is intended to account for:

- failed non-redundant components of a Protection System that may impact one or more Protection Systems;
- the duration that faults remain energized until Delayed Fault Clearing, and;
- additional system equipment removed from service following fault clearing depending upon the specific failed non-redundant component of a Protection System.

The SPCS/SAMS report described voltage or current sensing devices as having a lower level of risk of failure to trip due to robustness and likelihood to actually cause tripping upon failure. Therefore, these components of a Protection System are omitted from Footnote 13.

Noting that Requirement R3, Part 3.3.1 and Requirement R4, Part 4.3.1 require simulation of Protection System action, the drafting team sought to limit the scope of Footnote 13, item 1 with respect to protective relays that may be non-redundant components of a Protection System. Specifically, Footnote 13 limits single protective relays that may be a SPF to those which respond to electrical quantities and are used for primary protection resulting in Normal Clearing. An SPF in a single protective relay that is a non-redundant component of a Protection System may result in the primary Protection System failing to properly operate, leading to Delayed Fault Clearing performed by backup protective relays and/or overlapping zonal protection. Conversely, the drafting team did not include backup protective relays in the scope of Footnote 13, item 1 given that an SPF in a single protective relay used for backup protection will not affect primary protection resulting in Normal Clearing.

The drafting team recognizes that Bulk Electric System (BES) Elements are predominantly protected by relays which respond to electrical quantities. However, in some Protection System designs, non-redundant single protective relays which respond to electrical quantities may be redundant to protective relays that do not respond to electrical quantities. For example, an independent differential relay and independent sudden pressure relay may protect the same transformer from faults inside the transformer tank. In this example, the differential relay responds to electrical quantities, while the sudden pressure relay does not. While the transformer differential relay may be an SPF, an internal transformer tank fault may not lead to Delayed Clearing given the sudden pressure protection, provided, in this example, that the resulting clearing time is similar to that achieved with the differential relay. Subsequently, the P5 event, for a single phase-to-ground (line-to-ground) fault, and P8 event, for a 3-phase fault, in the transformer tank need not be simulated for Delayed Fault Clearing due to the SPF of the transformer differential relay if the resulting clearing time is similar to that achieved with the differential relay. However, care must be taken when evaluating protective relays which respond to electrical quantities in combination with protective relays which do not respond to electrical quantities; in this same example, faults that occurred outside of the transformer tank given the SPF of the non-redundant transformer differential relay would be unaffected by the presence of the sudden pressure relay and would lead to delayed clearing, necessitating its assessment as P5 and P8 events.

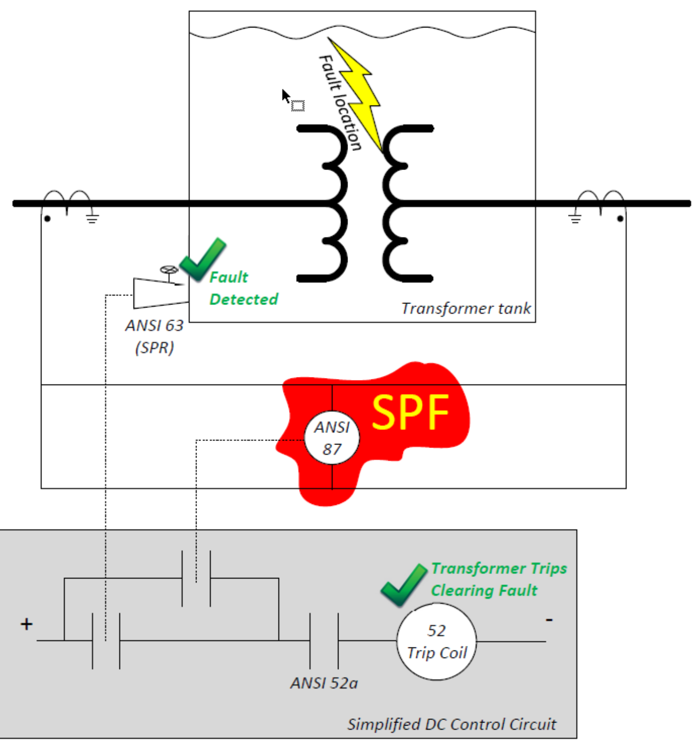

Figure 2.1: Internal Transformer Tank Fault with Sudden Pressure Protection and failed Transformer Differential Relay

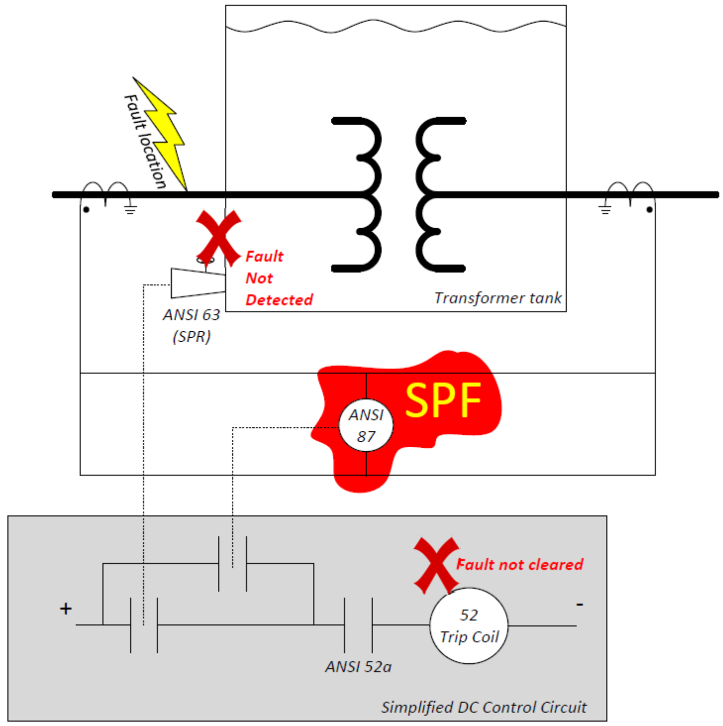

Figure 2.2: External Transformer Tank Fault with Sudden Pressure Protection and failed Transformer Differential Relay

Given the increasing importance of communication-aided Protection Systems (e.g., pilot protection schemes, direct transfer tripping schemes, permissive transfer tripping schemes, line differential relaying schemes, etc.), the proper operation of the communication system must be considered when considering potential SPF components of Protection Systems. The drafting team augmented the SAMS/SPCS recommendations to include reference to the subset of communication systems that are part of a communication-aided Protection System, necessary where the performance of that Protection System is required to achieve Transmission System Planning (TPL) Performance Requirements, enumerated in Table 1 of TPL-001-4. In other words, a communication-aided Protection System that may experience an SPF, causing it to operate improperly or not at all, must be considered as part of non-redundancy. The drafting team concluded that, although the failure of communication-aided Protection Systems may take many forms, by monitoring and reporting the status of these systems, the overall risk of impact to the Bulk Electric System can potentially be reduced to an acceptable level. However, monitoring and reporting the status of these systems can only really be considered as a sufficient alternative to physical redundancy if the result is prompt notification and remediation which minimizes the exposure to and consequence of this failed component. Most new Protection Systems deployed in the industry include communication-aided protection with component and communication failure alarms monitored at centralized Control Centers. Therefore, this requirement is more applicable to legacy systems that need communication-aided Protection Systems to meet performance requirements of the TPL standards.

The drafting team adopted the fundamental principles of the SAMS/SPCS recommendations regarding station protection system DC supply. Failure of a single station protection system DC supply is a significant point of failure as it will prevent the operation of all local protection, including back-up protection. The drafting team partly modified the SAMS/SPCS recommendation regarding single station DC supply, including removal of the specific requirement that reporting the detection of an abnormal condition to a location where corrective action can be initiated must occur within 24 hrs. This modification recognizes the wide variety of reporting and monitoring that exists. However, it remains the intention of Footnote 13, item c, that monitoring and reporting the status of the DC supply can only really be considered as a sufficient alternative to physical redundancy if the result is prompt notification and remediation which minimizes the exposure to and consequence of DC supply failure. Similar to as noted with communication-aided Protection Systems, most new Protection Systems include DC supply status alarms which are monitored at centralized Control Centers; however, they may not necessarily be monitored for both low voltage and open circuit Therefore, this requirement may be more applicable to legacy systems.

The Distinction Between Category P4 and Category P5/P8 Planning Events

"Table 1 – Steady State and Stability Performance Planning Events," makes a clear distinction between breaker failure, Category P4 Planning Events, and failure of a non-redundant component of a Protection System, Category P5 and P8 Planning Events. The sequence and timing of Protection System action leading to Delayed Clearing may be quite different between the two fundamentally different causalities. Category P4 events involving the failure specifically of a circuit breaker assume that only the circuit breaker has failed, and that all other protection functions, including proper initiation of local breaker failure operation, has occurred correctly. For Category P5 and P8 Planning Events, failure of the various non-redundant components of a Protection System, as enumerated in Table 1, Footnote 13, can result in a relatively broader range of final system states, resulting from the Delayed Clearing associated with the specific SPF, and which may or may not resemble the system states resulting from Delayed Clearing associated with circuit breaker failure.

Single Points of Failure – Category P5 and P8 Planning Events

Analysis of the data collected under the Order No. 754 Data Request demonstrates the existence of a reliability risk associated with SPF in Protection Systems. Further, while the analysis shows that the risk from SPF is not an endemic problem and instances of SPF exposure are lower on higher voltage systems, the risk is sufficient to warrant action. Risk-based assessment should be used to identify Protection Systems of concern (i.e., locations on the BES where there is a susceptibility to unacceptable system performance if a Protection System component SPF exists).

The drafting team has modified Table 1, Footnote 13 to capture the SAMS/SPCS recommendations for Category P5 events, which expands beyond the previously limited set of relays identified in TPL-001-4, to capture the identified single points of failure of concern.

Proposed revisions to "Table 1 – Steady State and Stability Performance Planning Events", adds a new P8 Planning Event to include a 3-phase fault and failure of a non-redundant component of a Protection System. Footnote 13 of the "Table 1 – Steady State & Stability Performance Footnotes" describes the non-redundant Protection System components to be considered for Category P5 and the proposed new Category P8 Planning Events

Given the risk to BES reliability raised at the FERC Technical Conference in conjunction with the SAMS/SPCS recommendations, the drafting team considered the manner in which additional emphasis in planning studies should be placed on assessment of three-phase faults involving Protection System SPF. While events initiated by a three-phase fault are less probable than events initiated by a single-phase-to-ground faults, single-phase-to-ground faults with Delayed Clearing, particularly associated with the non-redundant components of a Protection System enumerated in Table 1, Footnote 13, can often evolve into three-phase faults, leading to system performance which is more severe than for the Table 1, P5 event. To address this concern (the study of Protection System SPF with a three-phase fault), the drafting team has developed a new P8 Planning Event; however, unlike the Category P1-P7 Planning Events, a Corrective Action Plan is only required if the P8 event results in Cascading. Accepting more severe system performance is seen as a reasonable balance with the lower likelihood, but reasonable risk, of the SPF with a three-phase fault. Table 1, Footnote 13 also provides the attributes of the specific non-redundant Protection System components that the entity shall consider for evaluation for the P5 and P8 events.

It is anticipated that the most cost-effective Corrective Action Plans to address unacceptable system performance for the P5 and P8 Planning Events will likely be to add Protection System component redundancy, consistent with the components enumerated in Footnote 13. Protection System redundancy changes to address P5 concerns should also reduce or even negate non-redundant components that need to be considered in P8 events; hence, potentially mitigating many P8 concerns.

The P5 event steady-state analysis should also be valid and representative of P8 events. It should be noted that the addition of the P8 event will only add the need for additional stability analysis.

Requirement R4 Parts 4.2 and 4.5

The drafting team proposes non-substantive editorial changes to combine part of Requirement R4, Part 4.5 with Requirement R4, Part 4.2. The rearrangement of Requirement 4, Parts 4.2 and 4.5 were done to improve consistency within the Standard and do not create any new requirements. However, it should be noted that the evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the (extreme) event is intended to support and encourage the implementation of reasonable low-cost, cost-effective measures to lessen the risk or severity of these events.

Section 2: FERC Order No. 786 Directives

Background

In addition to addressing reliability issues involving SPF on Protection Systems, proposed Reliability Standard TPL-001-5 revises the TPL-001 standard to address two directives from FERC Order No. 786.

Order No. 786 P. 40: Maintenance outages in the Planning Horizon

FERC Order No. 786, Paragraph 40 directs NERC to modify Reliability Standard TPL-001-4 to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments. Order No. 786 provides the following considerations:

- Planned maintenance outages less than six months may result in impacts during peak and off-peak periods;
- Planned outages during those times should be considered to allow for a single element to be taken out of service without compromising the ability to meet demand;
- Criticality of elements taken out for maintenance could result in N-1 outage and loss of non-consequential load or impact to reliability;
- Planned outages are not "hypothetical outages" and should not be treated as multiple contingencies in the planning standard (should be addressed in N-0 base case);
- Relying on Category P3 and P6 is not sufficient and does not cover maintenance outages;
- The Near-Term Transmission Planning Horizon requires annual assessments using Year One or year two and year five. Known planned facility outages of less than six months should be addressed so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon.

NERC SAMS Whitepaper Recommendations

To address this directive, the NERC SAMS recommended modifications to NERC Reliability Standards IRO-017-1 and TPL-001-4. The SAMS recommended that IRO-017-1 be used as the vehicle to assure that all types of known scheduled outages are being reviewed and coordinated to mitigate reliability impact as the most cost-effective means to address the intent of the NERC directive. The NERC SAMS also recommended modifying TPL-001-4, Requirement R1, Part 1.1.2 by removing "with duration of at least six months" and adding language referencing the outage coordination process developed in IRO-017-1, Requirement R1 as described above.

To understand the relationship between outage coordination and Transmission Planning Assessments, and how those relate to the FERC Order 786 directive and the current state of NERC Reliability Standards, SAMS considered the following:

- The duration of planned maintenance and construction outages can range from hours to many months or years. The impact that these outages can have on reliable operation of the BPS are irrespective of the duration of these outages, depending on many factors.
- Longer-term assessment of short-term outages or even longer-term outages is often considered an "academic exercise" due to concurrent outages, outage coordination practices and procedures, outage rescheduling and redesign, and alternative outage methods.
- The directives in FERC Order 786 pre-date the development of IRO-017-1, which was developed specifically to recognize the importance of outage coordination.
- Regional differences result in different outage coordination methods and procedures.

Revisions to TPL-001-4

Requirement R1 Part 1.1.2

The drafting team gave due consideration to the NERC SAMS recommendations and to a range of opinions and options regarding how to determine which known outages to include in the Near-Term Planning Assessment, which included varying perspectives, such as that:

- the RC should not be consulted or involved at all in Planning Assessments,
- it is reasonable, appropriate, and efficient to consult with the RC,
- IRO-017 is adequate and applicable as it exists or with some modification, or
- maintenance outage selection for planning purposes should be at the sole discretion of the TP or PC.

The range of these options reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these types of outages. Those differences contribute to a legitimate difficulty in designing a reasonable and cost-effective "one size fits all" means of addressing the FERC directive. However, FERC's Order 786 requires that the issue be addressed. The rationale for selecting the known outages to be studied must be well thought out and available.

The drafting team modified Requirement R1, Part 1.1.2 consistent with FERC's directive, eliminating the specified six month outage duration and recognizing the various means that TPs and PCs currently employ to consider the maintenance outages of concern, while meeting the requirements of Order No. 786. The proposed modifications place limitations on the known outages that need to be studied.

It is only necessary to consider known outages expected to result in Non-Consequential Load Loss for P1 event in Table 1. This allows the PC and TP to use applicable means to assess which known outages are significant and prevents the need for conducting unnecessary modeling of outages which the PC and TP do not expect to be a problem.

Consistent with the intention of Order No. 786, the drafting team included the specification that the limitation of known outages to be modeled cannot be based solely on the outage duration. However, the presence of other accompanying factors, which in conjunction with outage duration, may form a reasonable basis for supporting that the known outage need not be modeled.

The PC and TP must have documented either an established procedure or technical rationale for the determination of which known outages may be excluded from modeling. The established procedure is intended to include consultation with the affected Reliability Coordinator, consultation with outage Transmission and/or Generator Owner(s), or application of established outage coordination processes. The technical rationale is intended to include well-reasoned technical bases for making the determination.

This proposed modification is for consideration of known outages beyond the Operations Planning time horizon.

Requirements R2 Part 2.1.3 and Part 2.4.3

Consistent with FERC's directive, the drafting team modified Requirements **R2 Parts** 2.1.3 and 2.4.3 to further recognize the intent to limit required study to only those known outages that are expected to produce severe System impacts on the PC/TP's respective portion of the BES.

Order No. 786 P 89: Dynamic assessment of outages of critical long lead time equipment

In paragraph 89 of Order No. 786, FERC stated:

> The spare equipment strategy for steady state analysis under Reliability Standard TPL-001-4, Requirement R2, Part 2.1.5 requires that steady state studies be

> performed for the P0, P1 and P2 categories identified in Table 1 with the conditions that the system is expected to experience during the possible unavailability of the long lead time equipment. The Commission believes that a similar spare equipment strategy for stability analysis should exist that requires studies to be performed for P0, P1 and P2 categories with the conditions that the system is expected to experience during the possible unavailability of the long lead time equipment.

FERC did not direct a change but did direct NERC to consider this issue upon the next review cycle of TPL-001-4. The Project 2015-10 Standard Authorization Request included this issue within the scope of this project.

NERC SAMS Whitepaper Recommendations

The NERC SAMS considered the following key points related to FERC's Paragraph 89 guidance:

- Removal of Elements in the Planning Assessment for spare equipment strategy is only applicable for those Elements that have "a lead time of one year or more."
- Each long-lead time Element that is removed from service creates a new operating condition considered the "normal" (P0) condition for Table 1. The applicable contingencies will be studied with that Element removed from service in the pre-contingency state for stability analysis. For example, if a long-lead time transformer does not have a spare, it would be studied as a P1.3 event. Since P0 does not include an Event, P0 does not and should not be included in the stability analysis section for long-lead time Elements not included as part of a spare equipment strategy.
- System adjustments may need to be made to the power flow base case to accurately reflect reasonable and expected operating conditions with that Element removed from service in the pre-contingency (P0) operating state.
- TPL-001-4, Requirement R4, Part4.1.1, related to P1 Events, requires that no generating unit pull out of synchronism. The outage of a long-lead time Element followed by a P1 contingency should not result in a generating unit losing synchronism.
- TPL-001-4, Requirement R4, Part 4.1.2, related to P2 Events, allows for generating units to pull out of synchronism. The outage of a long-lead time Element followed by a P2 contingency should not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities.

The NERC SAMS white paper contains the flowing recommendations for stability analysis for long lead time Elements not included as part of a spare equipment strategy:

- The outage of long lead time Elements has an equally important impact from a stability standpoint as it does from a steady-state standpoint.
- The Planning Coordinator and Transmission Planner must demonstrate that they have met the TPL-001-4 performance criteria for specified contingency events and contingency combinations thereof as per Table 1. This should include long lead time outages that can occur for equipment that does not have a spare equipment strategy.
- TPL-001-4, Requirement R4, Part4.1.1 requires that no generating unit pull out of synchronism, while R4.1.2 allows for generating units to pull out of synchronism so long as the resulting instability does not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities. The outage of a long lead time Element followed by a P1 contingency should not result in a generating unit losing synchronism.

- While the P2 contingency allows for individual generating unit instability, the Transmission Planner and Planning Coordinator must ensure that this instability does not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities and therefore should include P2 contingencies event.

Revisions to TPL-001-4

Requirement R2 Part 2.4.5

Consistent with FERC's Order No. 786 guidance and the SAMS recommendations, the Project 2015-10 standard drafting team revised TPL-001-4 Requirement R2, Part 2.4.5 to add a similar requirement for stability analysis. The change to Requirement R2, Part 2.4.5, which includes similar language to that used for the steady-state analysis under Requirement R2, Part 2.1.5, adds clarity that the outage of long lead time Elements has an equally important impact from a stability standpoint as it does from a steady-state standpoint and should be assessed commensurate with an entity's spare equipment strategy.

Section 3: Applicability

The requirements remain applicable to the Planning Coordinator and Transmission Planner. Coordination and cooperation between operating and planning entities in concert with asset owners will be required to implement the standard requirements. The planning and protection engineers that will need to conduct the studies and submit the data may be working for different companies or business units, and time will be required to accommodate the development of processes and data flow that cross company or business unit lines.

Generator Owners, Transmission Owners, and Distribution Providers are required to evaluate the Protection System(s) for locations on the system where a failure of a non-redundant Protection System component could result in a potential reliability risk. These entities must provide this information, as well as resulting fault clearing times, to Transmission Planners for proper study.

Project 2015-10 Single Points of Failure TPL-001

Cost Effectiveness

Known Outages FERC Order No. 786

FERC Order No. 786 Paragraph 40 directs a change to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments. See paragraphs 33-45 for the discussion on planned maintenance outages.

Overview of Commission Determination (Paragraphs 40-45)

The commission stated in Order No. 786 Paragraph 41:

- For the reasons discussed below, the Commission finds that planned maintenance outages of less than six months in duration may result in relevant impacts during one or both of the seasonal off-peak periods.
- Prudent transmission planning should consider maintenance outages at those load levels when planned outages are performed to allow for a single element to be taken out of service for maintenance without compromising the ability of the system to meet demand without loss of load.
- We agree with commenters such as MISO and ATCLLC that certain elements may be so critical that, when taken out of service for system maintenance or to facilitate a new capital project, a subsequent unplanned outage initiated by a single-event could result in the loss of non-consequential load or may have a detrimental impact to the bulk electric system reliability.
- A properly planned transmission system should ensure the known, planned removal of facilities (i.e., generation, transmission or protection system facilities) for maintenance purposes without the loss of non-consequential load or detrimental impacts to system reliability such as cascading, voltage instability or uncontrolled islanding.

The Commission Disagreed with the following:

- Order No. 786 Paragraph 44: The existing TPL-001-4 for Category P3 covers generator maintenance outages, Category P6 covers transmission maintenance outages.
- Order No. 786 Paragraph 45: Planned outages of less than one year in duration should be addressed operationally by determining new operating limits and taking other actions to mitigate the planned outage.
- Order No. 786 Paragraph 45: Planned outages of less than six months is unnecessary since…10 year time frame.

Options Considered By Standard Drafting Team to Satisfy FERC Order

The following options considered by the NERC Standard Drafting Team for Requirement R1 Part 1.1.2 include (refer to SAMS recommendations):

Current Option (Draft 3):

1.1. System models shall represent:

1.1.1. Existing Facilities.

1.1.2. Known -outage(s) of generation or Transmission Facility(ies) scheduled in ~~as selected in consultation with the Reliability Coordinator for~~ the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1. ~~for analyses pursuant to Requirement R2, parts 2.1.3 and 2.4.3~~Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with the selected known outage(s); and

1.1.2.2. Does not exclude known outage(s) solely based upon the outage duration.

~~1.1.2.~~**1.1.3.** New planned Facilities and changes to existing Facilities.

~~1.1.3.~~**1.1.4.** Real and reactive Load forecasts.

~~1.1.4.~~**1.1.5.** Known commitments for Firm Transmission Service and Interchange.

~~1.1.5.~~**1.1.6.** Resources (supply or demand side) required for Load.

Option considered for Draft 3:

Requirement R1, Part 1.1.2 Known outages(s) of generation or Transmission Facility(ies) with duration of at least ~~six~~ four months and any other significant planned outages of generation or Transmission Facility(ies) with a duration of less than four months that are expected to produce more severe System impacts on its portion of the BES. ~~These~~ This outage coordination~~s~~ ~~are~~ is required to be performed for the season/load-levels that outages are normally planned at and shall be performed only in the Near-Term Transmission Planning Horizon.

Previous Option (Draft 2)

1.1.2 Known outage(s) of generation or Transmission Facility(ies) ~~with a duration of at least six months.~~as selected in consultation with the Reliability Coordinator for the Near-Term Planning Horizon for analyses pursuant to Requirement R2, parts 2.1.3 and 2.4.3.

Standard Drafting Team Proposal for Requirement R1 Part 1.1.2

The SDT did not feel like a time duration alone would capture "significant outages". Additionally, the language allows PC's to develop a process for selecting "significant outages" to be studied in the Near-Term Transmission Planning Horizon.

Single Point of Failure of the Protection System

Based on Order No. 754 directive of September 15, 2011; NERC informational filing dated March 15, 2012; Section 1600 data request; and the 2nd NERC informational filing dated October 30, 2015, the SPCS/SAMS report to address the concern of Single Point Of Failure of a protection system:

- For Table 1 – Steady State & Stability Performance Planning Events, Category P5:
  - Replace "relay" with "component of a Protection System," and
  - Add superscript "13" to reference footnote 13 for the replaced term under the "Category" column.
- For Table 1 – Steady State & Stability Performance Extreme Events, under the Stability column, No. 2:
  - Remove the phrase "or a relay failure13" from items a, b, c, and d to create distinct events only for stuck breakers.
  - Append four new events for the same items a, b, c, and d in the above bulleted item to create distinct events replacing "a relay failure13" with "a component failure of a Protection System13."
- Replace footnote 13 in TPL-001-4 with, "The components from the definition of "Protection System" for the purposes of this standard include (1) protective relays that respond to electrical quantities, (2) single-station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), and (3) DC control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices."[1]
- Modify TPL-001-4 (Part 4.5) so that extreme event assessments must include evaluation of the three-phase faults with the described component failures of a Protection System13 that produce the more severe system impacts. For example, add a new second sentence that reads "[t]he list shall consider each of the extreme events in Table 1 – Steady State & Stability Performance Extreme Events; Stability column item number 2."

Revision By Standard Drafting Team to Satisfy FERC Order

Since some of the recommendations from the SPCS and SAMS report were so specific, there were no other options considered for the following:

- For Table 1 – Steady State & Stability Performance Planning Events, Category P5:
  - Replace "relay" with "component of a Protection System," and

- Add superscript "13" to reference footnote 13 for the replaced term under the "Category" column.

- For Table 1 – Steady State & Stability Performance Extreme Events, under the Stability column, No. 2:
    - Remove the phrase "or a relay failure" from items a, b, c, and d to create distinct events only for stuck breakers.
    - Append four new events for the same items a, b, c, and d in the above bulleted item to create distinct events replacing "a relay failure" with "a component failure of a Protection System."

Different options were considered for footnote 13 language.

Current Option Footnote 13 (Draft 3)

1. For purposes of this standard, non-redundant components of a Protection System to consider are as follows:
    - A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times~~, e.g. sudden pressure relaying~~;
    - A single communications system, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing, which is not monitored or not reported at a Control Center;
    - A single station dc supply associated with protective functions required for Normal Clearing, and that single station dc supply is not monitored or not reported at a Control Center for both low voltage and open circuit;
    - A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing.

Previous Option Footnote 13 (Draft 2)

The previous option was to have footnote 13 list four of the five components of a protection system but limit *"communications systems"* to only those that are not monitored or alarmed. The following is language for Footnote 13[1]:

13. For the purposes of P5 of this standard, components of a Protection System include the following:

    a. A single protective relay which responds to electrical quantities, without an alternative that provides comparable Normal Clearing times, e.g. sudden pressure relaying;

    b. A single communications system, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing, which is not monitored or not reported;

[1] Failure of voltage and current sensing device would result in a breaker operation without a fault which was considered not a reliability risk to the BES.

c. A single dc supply associated with protective functions, and that single station dc supply is not monitored or not reported for both low voltage and open circuit;

~~a.~~d. A single control circuitry associated with protective functions including the trip coil(s) of the circuit breakers or other interrupting devices.

Standard Drafting Team Proposal for Table 1 Footnote 13:

The Standard Drafting Team added clarifications to the previous draft option which expands Protection System components to be considered to determine the impact to the BES if that component failed when a fault occurs.

Extreme Events and P8 Category:

The SPCS and SAMS report for Order No. 754 recommended that three phase faults involving single points of failure of a protection system be addressed. Additionally, the standard drafting team recognized that the Order No. 754 data requirement collected data for a three-phase fault and not a single-line-ground fault. The Order No. 754, Section 1600 data collection and report indicated a risk to the BES for three phase faults followed by single points of failure of a protection system. Therefore, the SDT decided to make Category P8 planning event if a three-phase fault following by a single points of failure resulted in Cascading or instability.

Revision By Standard Drafting Team to Satisfy FERC Order

Current Option (Draft 3):

~~4.2.~~ Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.2.1~~. If the analysis concludes there is Cascading caused by the occurrence of extreme events, excluding extreme events 2e-2h in the stability column, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.~~

~~4.2.2. If the analysis concludes there is Cascading caused by the occurrence of extreme events 2e-2h in the stability column, an evaluation of possible actions designed to prevent the System from Cascading shall:~~

~~4.2.2.1. List System deficiencies, the associated actions needed to prevent the System from Cascading, and the associated timetable for implementationList System deficiencies, the associated actions, and an associated timetable for implementation needed to prevent the System from Cascading.~~

~~4.2.2.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.~~

Previous Option (Draft 2):

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.

4.2.1. If the analysis concludes there is Cascading caused by the occurrence of extreme events, excluding extreme events 2e-2h in the stability column, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

4.2.2. If the analysis concludes there is Cascading caused by the occurrence of extreme events 2e-2h in the stability column, an evaluation of possible actions designed to prevent the System from Cascading shall:

4.2.2.1. List System deficiencies, the associated actions needed to prevent the System from Cascading, and the associated timetable for implementation~~List System deficiencies, the associated actions, and an associated timetable for implementation needed to prevent the System from Cascading~~.

4.2.2.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.

Standard Drafting Team Proposal

The standard drafting team feels that there is a reliability risk to the BES if Cascading or instability results in a three-phase fault followed by single point of failure of a protection system. There was confusion in the industry with the language that was similar to a CAP but not exactly a CAP. Therefore, the standard drafting team decided to create a P8 planning event which required a CAP if Cascading or instability occurs.

Standards Announcement

Reminder

Project 2015-10 Single Points of Failure

Ballots and Non-binding Poll Open through April 23, 2018

Now Available

An additional ballot for **TPL-001-5 – Transmission System Planning Performance Requirements,** an initial ballot for the implementation plan**,** and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Monday, April 23, 2018.**

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here. If you experience difficulties navigating the SBS, contact Wendy Muller.

- *If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual**.**

For more information or assistance, contact Senior Standards Developer, Latrice Harkness (via email) or at (404) 446-9728.

Standards Announcement

Project 2015-10 Single Points of Failure

Formal Comment Period Open through April 9, 2018

Now Available

A 45-day formal comment period for **TPL-001-5 – Transmission System Planning Performance Requirements** is open through **8 p.m. Eastern, Monday, April 9, 2018.**

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. If you experience issues navigating the SBS, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

- *If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

An additional ballot for the standard, an initial ballot for the implementation plan, and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) will be conducted **March 30 – April 9, 2018.** The existing TPL-001-5 ballot pool was used for the initial ballot of the implementation plan.

For information on the Standards Development Process, refer to the Standard Processes Manual**.**

For more information or assistance, contact Senior Standards Developer, Latrice Harkness (via email) or at (404) 446-9728.

Comment Report

Project Name:	Project 2015-10 Single Points of Failure | TPL-001-5
Comment Period Start Date:	2/26/2018
Comment Period End Date:	4/23/2018
Associated Ballots:	2015-10 Single Points of Failure TPL-001-5 AB 2 ST 2015-10 Single Points of Failure TPL-001-5 Implementation Plan IN 1 ST

There were 70 sets of responses, including comments from approximately 190 different people from approximately 117 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the creation of the proposed P8 event?

2. Do you agree with the changes to TPL-001-4 Requirement 1, Part 1.1.2, in order to meet the FERC directive in Order No. 786?

3. Do you agree with the proposed implementation plan?

4. Do you agree with the proposed revisions to TPL-001-4?

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754?

1. Do you agree with the creation of the proposed P8 event?

Joe McClung - JEA - 3,5 - FRCC, Group Name JEA Voters

Answer	No
Document Name	

Comment

JEA appreciates the effort of the SDT to address the directives from the Commission on Order No. 786 as well as the recommendation in response to Order No. 754 from the SPCS and the SAMS from the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request which hereafter is called “Joint Report”).

However, the proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report listed as one alternative the elevation of the P8 type events ‘to a planning event with its own system performance criteria’ (Joint Report, **Chapter 2 – Alternatives**, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that “**Probability of three phase fault with a protection system failure is low enough that it does not warrant a planning event**”. The creation of the proposed P8 event in this version has clearly overlooked this fact.

The Joint Report does agree that there is “the existence of a reliability risk associated with the single points of failure in protection system that warrants further action” (JEA agrees with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, **Chapter 3 – Conclusion**, pg 11). Accordingly, the SAR has defined the scope of the SDT’s work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the “analysis indicates an inability of the System to meet the performance requirements in Table 1” which would include the P8 event.

Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5.

Suggestion: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission’s concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Response

Silvia Mitchell - NextEra Energy - Florida Power and Light Co. - 6

Answer	No
Document Name	

Comment

NextEra does not support P8 events being considered as planning events instead of extreme events. A 3PH fault plus protection system failure is a very low probability event.Ne

Comment
For the HV BES level, both Categories P5 and the new P8 events require the same performance for both a SLG fault and a 3-Phase fault. BPA believes the performance for the existing P5 is more conservative and the P8 Category is not required for the HV BES level. In addition, BPA suggests deleting the new P8 and modifying P5 to include a row for 3Ø (three phase) for the EHV BES level only allowing interruption of firm transmission service and non-consequential load loss.

Comment
Adding P8 changes a an EXTREME contingency to a CREDABLE contingency. A 3 phase fault with delayed clearing was an extreme event under category D on Table 1 of the original TPL standards. This contingency has always been an extreme contingency. The question not being addressed is, “what reliability improvement can be accomplished by adding P8?”. If P8 studies show instability, there is no requirement for a corrective action plan. Keeping in mind that this is a required standard, why create a P8 contingency, which will increase the work load and cause additional distractions, when the results don’t matter?

Response
Kristine Ward - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC

Answer	No
Document Name	

Comment

Seminole is in agreement with the comments submitted by JEA but would like to provide additional comments relating to the proposed P8 Event. In reviewing the Cost Effectiveness document, the Technical Rationale, the SPCS/SAMS Order 754 Report, and the proposed redline to the existing TPL-001 Reliability Standard, Seminole does not believe that the proposed P8 Planning Event is prudent and the technical rationale is flawed in light of what the SPCS/SAMS documented in their review of the Order 754 Data Request analysis. As documented by JEA, the SPCS/SAMS never recommended making a three-phase fault with a single point of failure a Planning Event unless it included its own performance criteria. Additionally, the SDT and the SPCS/SAMS clearly recognize that a three-phase fault is in and of itself an event that has a low probability of occurrence, and adding a low probabilistic single point of failure of a protection system on top and requiring that this be analyzed as a Planning Event is beyond prudent planning and results in diminishing returns from an analysis and cost effectiveness standpoint. The SDT also made a gross assumption in regards to the amount of work required to evaluate these events by stating that the P8 Planning Event does not require steady state evaluation and “ONLY” requires stability analysis as to insinuate that the level of work is somehow lessened by making this statement.

The cost effectiveness document falls short of providing any substantive cost effectiveness in regards to the additional analysis that would be required by the addition of Planning Event P8

Suggestion:

The existing Extreme Event within Table 1, 2f., allows for the Transmission Planner to use operating experience to develop a contingency event that would result in a wide-area disturbance, such a disturbance that one could presume would cause Cascading, voltage instability or uncontrolled islanding. Operating experience would bring one to the conclusion that the proposed P8 Planning Event is in fact a low probabilistic event and should NOT be considered a Planning Event but rather an Extreme event that is already part of the Extreme Event Table within Table 1

PRPA supports JEA comments.

JEA appreciates the effort of the SDT to address the directives from the Commission on Order No. 786 as well as the recommendation in response to Order No. 754 from the SPCS and the SAMS from the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request which hereafter is called “Joint Report”).

However, the proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report listed as one alternative the elevation of the P8 type events ‘to a planning event with its own system performance criteria’ (Joint Report, Chapter 2 – Alternatives, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that “Probability of three phase fault with a pro low enough that it does not warrant a planning event”. The creation of the proposed P8 event in this version has clearly overlooked this fact.

The Joint Report does agree that there is “the existence of a reliability risk associated with the single points of failure in protection system that warrants further action” (JEA agrees with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, Chapter 3 – Conclusion, pg 11). Accordingly, the SAR has defined the scope of the SDT’s work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the “analysis indicates an inability of the System to meet the performance requirements in Table 1” which would include the P8 event.

Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5.

Suggestion: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 subrequirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This subrequirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from

Unofficial Comment Form Project 2015-10 and Single Points of Failure | February 2018 3
draft 2) and the clarified Footnote 13 will adequately address the Commission’s concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Response

Thomas Foltz - AEP - 5

Answer	No
Document Name	

Comment

AEP does not agree with the creation and inclusion of P8 for the following reasons:

1. We see nothing within the project’s final SAR which would accommodate the addition of a completely new Performance Planning Event in Table 1. As a result, we believe its proposed inclusion goes beyond the scope of the SAR.

2. The creation of P8 introduces an inconsistent treatment of breaker failure. A 3-phase fault with the failure of a non-redundant component of a Protection System (footnote 13.d, such as the failure of single-control circuitry that would prevent tripping but initiate breaker failure) that results in a breaker failure operation is considered a Planning Event in P8. However, the same 3-Phase fault with a stuck breaker is included under Extreme events in the Stability column and results *in the exact same event*. If a 3-phase fault results in a breaker failure operation, what is the reliability benefit of differentiating the cause between a Protection System component failure or a stuck breaker? While AEP disagrees with many aspects of the recently-proposed revisions, the concerns expressed in this paragraph are the primary drivers behind our decision to vote negative during this comment/ballot period.

3. AEP is concerned that the inclusion of P8, coupled with its indistinct relationship to P5, will lead to inconsistent decision-making when using and applying Table 1. This was well illustrated during the March 22nd webinar by both the questions posed and the responses and insight provided by Chris Colson. A number of possible scenarios were provided by remote attendees seeking insight how the table should be correctly applied in those cases. At

times, Mr. Colson expressed appreciation for the thought process, reasoning, and “logical analysis” used by those who were posing the questions and referencing Table 1. Our own impressive was different however, as we believe referencing the Table in such a “nonlinear” or “cyclical” way would actually lead to inconstant interpretation and application of the table. As a result, we believe it is possible (and perhaps even likely) that the table will not be consistently applied.

In our response to Question #4, AEP has provided possible alternatives to P8's inclusion for the drafting team to consider.

Comment

Santee Cooper supports JEA’s comments on this standard. No, the addition of the P8 event in Table 1 goes beyond what is required by the SAR. The Joint Report cited that the probability of a three-phase fault with protection system failure is low enough that it does not warrant a planning event. The creation of the P8 event is not warranted and should be removed.

We agree with adding 3-phase fault contingency events with delayed clearing due to Footnote 13 non-redundant components for analysis to the TPL-001 standard. However, we propose that these events be added to the Stability 2.a-2.d contingencies in the Extreme Event section of Table 1, rather than a new P8 contingency category in the Planning Event section of Table 1. The level of risk (probability and impact) of these events on BES reliability, as well as the level of Corrective Action Plans that would be triggered by being categorized as Planning Event is unknown. But the reliability impacts the new contingencies can become known, if they are added to the extreme events section. These new contingencies could be reclassified as planning events in a future TPL-001 revision, if warranted by on the results of the extreme event analyses.

If the proposed P8 event contingencies are not reclassified as extreme events, then we suggest the addition of wording (see Footnote 14 suggestion for Question 4). This wording will make it clear to applicable entities and regulators that Transmission Planners (TPs) and Planning Coordinators (PCs) can first perform the 3-phase fault simulations first for contingencies. Then, only simulate a SLG fault of the corresponding contingency, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. The 3-phase fault contingency (P8) is expected to produce more severe System impacts than the corresponding SLG fault contingency (P5). The proposed Footnote 14

will help applicable entities avoid performing a significant amount of unnecessary and duplicative work with the confidence that regulators will not interpret that the unnecessary and duplicative work must be performed.

Comment

OG&E considers the proposal to categorize the P8 event as a Planning Event as being in conflict with the SPCS (System Protection and Control Subcommittee) and the SAMS (System Analysis and Modeling Subcommittee) recommendations contained in its "Order No. 754: Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" white paper ("Joint Report"). The SPCS and SAMS advised that three-phase fault Single Point of Failure events should remain categorized as Extreme Events and that "[probability] of a three-phase fault with a protective system failure is low enough that it does not warrant a planning event." *See* Order 754 Assessment at pp. 9 and 11.

Recommendation: Remove the P8 event from the proposed language. The occurrence of this type of event is rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 subrequirement 4.5 in draft 3 should

not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This subrequirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Comment	
Given the similarities between P5 and P8 events, NVE recommends that the proposed P8 events should replace the existing P5 events. It is expected that in most portions of the BES, there will be few, or no, SLG contingencies that would result in more severe impacts than the corresponding 3 phase fault contingencies with a failed non-redudant component of a Protection System. A Footnote 14 can be added to the Fault Type that allows the Transmission Planner or Planning Coordinator to change the fault type from 3 Phase to L-G based on the failure of the non-redundant component of a Protection System being studied (i.e. a SLG fault for a failure of a single phase electromechanical relay) or based on the impact to the system.

We agree with adding 3-phase fault contingency events with delayed clearing due to Footnote 13 non-redundant components for analysis to the TPL-001 standard. However, we propose that these events be added to the Stability 2.a-2.d contingencies in the Extreme Event section of Table 1, rather than a new P8 contingency category in the Planning Event section of Table 1. The level of risk (probability and impact) of these events on BES reliability, as well as the level of Corrective Action Plans that would be triggered by being categorized as Planning Event is unknown. But the reliability impacts the new contingencies can become known, if they are added to the extreme events section. These new contingencies could be reclassified as planning events in a future TPL-001 revision, if warranted by on the results of the extreme event analyses.

If the proposed P8 event contingencies are not reclassified as extreme events, then we suggest the addition of wording (see Footnote 14 suggestion for Question 4). This wording will make it clear to applicable entities and regulators that Transmission Planners (TPs) and Planning Coordinators (PCs) can first perform the 3-phase fault simulations first for contingencies. Then, only simulate a SLG fault of the corresponding contingency, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. The 3-phase fault contingency (P8) is expected to produce more severe System impacts than the corresponding SLG fault contingency (P5). The proposed Footnote 14 will help applicable entities avoid performing a significant amount of unnecessary and duplicative work with the confidence that regulators will not interpret that the unnecessary and duplicative work must be performed.

Comment

P5 events already covers the concern of failure of non-redundant protection systems with a single line to ground fault. The majority of multiple contingency events in TPL-001 only require analysis of a more frequent single line to ground fault. By including the P8 event, development of a corrective action plan may be required for a very low probability event (3-phase fault plus failure of a protection system). Ideally the drafting team should attempt to calculate probabilities and keep the single and multiple contingency categories within roughly a one in thirty year probability of occurring. All other less frequent events should be considered extreme and it should be up to the discretion of the Transmission Planner/Planning Coordinator whether investment is warranted.

If 3-phase faults are assumed to have a 1 in 10 year frequency and protection failure a 1 in 10 year frequency then a 3 –phase fault with protection failure has a 1 in 100 year frequency. Single phase faults have a higher probability of 1 in 1 year to 1 in 3 year depending on the voltage level. Protection failure with a single phase fault is closer to 1 in 30 years.

By creating the new “P8” single-point-of-failure category of events and by requiring a Corrective Action Plan (CAP) when such P8 events cause cascading or uncontrolled islanding, the Standard Drafting Team has clearly gone beyond the recommendation in the Standard Authorization Request (SAR). The SAR only recommends that the TPL-001-4 standard be revised “so that extreme event assessments must include evaluation of the three-phase faults with the described component failures of a Protection system.” It does not recommend or require that these new P8 events, which are extreme events, be held to a higher standard than thaFlppst of the other extreme events with a new event category unto itself. It also does not recommend or require that such events be mitigated with a CAP, a requirement that is not applied to any of the other extreme events. These P8 events are extreme events and should be held to the same criteria that is applied to the other extreme events.

SMUD supports the SAR recommendation to include single-point-of-failure events in its annual assessment of extreme events. SMUD does not, however, support the hard requirement to mitigate such events when studies indicate they may lead to cascading or uncontrolled islanding and prefers instead to leave the decision to mitigate such events to the Planning Coordinator and Transmission Planner just as such discretion exists for all other extreme events.

However, by including the P8 event in Table 1, it inappropriately and erroneously subjects the category P8, extreme events, to Requirement 2.7 that requires a CAP when performance requirements are not met, effectively exceeding the concepts included in the SAR.

The P8 events is an extreme event and needs to be held to the same requirements as applied to other extreme events.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF	
Answer	No
Document Name	
Comment	

Duke Energy disagrees with the creation of the proposed P8 as a Planning Event. The proposed addition of the P8 event goes beyond of what is required in the Standards Authorization Request (SAR). The joint report by the SPCS and SAMS subcommittees considered the events (similar to the proposed P8) to be ‘elevated to a planning event with its own system performance criteria’ (Chapter 2 – Alternatives of the Joint-report) as one of the alternatives, however, the joint report did NOT recommend this alternative citing the fact that “Probability of three protection system operate fault with a failure is low enough that it does not warrant a planning event”.

The probability of this event occurring is low, and the change of “relay” to “components of a Protection System” with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h is a significant improvement to the proposed TPL-001-5. It addresses ALL the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint-report.

The implementation of the proposed P8 event is NOT needed and should be removed. We believe that Requirement 4 sub-requirement 4.2 together with clarified P5 (Table 1), modified extreme events – stability 2e-2h (Table 1), and the clarified Footnote 13 will adequately address the Commission’s concerns.

Comment	

Neither the SAR, FERC Orders, or the SPCS/SAMS report appear to require or explicitly recommend the creation of a new planning event type in order to address single-point-of failure. Based on the data reported in NERC’s analysis of the Order 754 Data Request, the conclusion can be drawn that the majority of scenarios which will need to be analyzed under the P8 event will consist of lower voltage facilities which are less likely to create an “adverse system impact” as compared to higher voltage facilities that are more likely to have fully redundant protection systems. Such events are already included under the existing category of “extreme events” – a more efficient way to address the risks of critical SPF scenarios (as well as other critical vulnerabilities that might exist) might be to direct the TP or PC to develop a more defined process to screen extreme events, identify those which pose the greatest risk, and to determine those that may be appropriate to study and possibly mitigate.

Comment	

FMPA disagrees for the following reasons.

1. The revisions exceed the properly and dutifully developed scope of the SAR, and do so without any substantiated basis (e.g. there is no “new evidence” to suggest the scope of the SAR should have been exceeded). Creating a Planning level event was a specific option considered by the NERC System Protection and Control Subcommittee (SPCS) and System Analysis and Modeling subcommittee (SAMS) in their joint report, referenced in the Technical Rationale for this Project. The purpose of the SAMS/SPCS joint report was to evaluate the available data and make a recommendation as to the level of reliability risk that did, or did not, exist, and recommend paths forward to address those risks. Industry provided the data for the Section 1600 data request dutifully and faithfully entrusting SPCS and SAMS to carefully anyalze that data and make reasonable recommendations to industry, NERC and FERC based on the evidence. This is what SPCS and SAMS did. The joint report concluded a Planning level event was not warranted and made recommendations to ensure that Protection system failures with three phase faults were studied as extreme events.

2. Elevating an event to a Planning event when data does not suggest this is warranted creates complexity and confusion and puts other events at risk of the same fate and changes aspects of the planning standard that were working well and did not need to be changed. The joint report concluded there was a reliability risk. FMPA agrees with this. The joint report recommended modifying the extreme events and footnote 13 in the TPL-001-4 standard. Again, FMPA agrees with this approach – it makes sense given the data that industry provided in the Section 1600 data request. Effectively, a protection system failure with a three phase fault represents the same reliability risk as a breaker failure event with a three phase fault, which is already studied as an extreme event. This grouping was already contemplated in the prior revision of TPL-001-4; it was the over-simplification of the description of protection systems in the footnotes and lack of explicit statements in the extreme events list in Table 1 that created the reliability gap. The end result

of creating a Planning level event for Protection System failures would be to send the message that the other three phase fault extreme events which are statistically equivalent to them should also be studied as planning events.

3. FMPA disagrees with the Technical Rationale on three points and therefore does not agree that introduction of this P8 event is justified or warranted:

A. The Technical Rationale for this Project makes the argument that the reason a Planning Event is warranted is the mere fact that the joint report exists – a report which concluded the exact opposite. This makes no sense, and serves to undermine all the work industry, SPCS, and SAMS did in investigating the reliability risks and determining a path forward to address those risks.

B. The Technical Rationale's assertion that elevating protection system failures to a Planning Event is not significant since CAPs are only required if there is a risk of Cascading or or widespread electric service disruption doesn't make sense, since industry has previously, and through much development and debate, established the clear line that Planning events are based on more rigorous performance criteria than this. Hence, an event that is only required to be remedied if it causes Cascading or widespread electric service disruption (but not other performance criteria violations) is not a Planning Event and doing so only creates confusion in the standard where previously there was clarity.

C. FMPA also feels it is poor justification to claim that the prior round of industry comments requested the creation of this Planning event. The prior industry comments were solely a reaction to the confusion that was introduced into the standard when the SDT attempted to exceed the scope of the SAR by creating a quasi-third performance category. The result of this was industry felt forced to pick sides. FMPA does not believe any entity in industry, not one single commenter, would have recommended a Planning event if the original draft that was posted for comment had followed the scope of the SAR and left these events as extreme events where they belong.

FMPA would support doing what was recommended by the SPCS/SAMS joint report and what was written in the SAR for this project, and does not support exceeding the scope of the SAR nor the recommendation of the joint report, which this current proposition does. It is of the utmost importance that we send a message to industry that, when a 1600 data request is prepared and industry is asked to carefully analyze an issue, we will make use of that analysis and value it, and that when we request that changes to standards be based on careful, logical analysis, and that careful, logical analysis is completed, we follow the recommendations of that analysis.

To be very clear: FMPA believes protection system failures should be studied, and FMPA already studies protection system failures in a rigorous fashion.It is quite likely that, should FMPA identify performance issues due to protection system failures in its studies, FMPA and/or its members would upgrade its/their protection systems to address the observed issues. That is, good engineering and planning practices will be followed. However, FMPA believes that any system upgrades or CAPs that are mandated by the standard language should be based on reliability risks; and not just because they are "inexpensive or "easy".

Due to possible confusion with interpretation of the new P8 event, we do not fully agree with the implementation of the new event in the Standard.

The distinction and required performance criteria for the P5 and P8 events should be clarified and specifically documented within the Standard. As presented, Table 1 (Steady State & Stability Performance Planning Events) is difficult to interpret. One method to clarify the table might be to separate out the P8 event within Table 1 (Steady State & Stability Performance Planning Events) and specifically document the steady state and stability performance requirements for P8.

For example, it is not clear from the Standard if a Corrective Action Plan is only required if the P8 event results in Cascading.

One additional observation for Table 1 (Steady State & Stability Performance Planning Events). Per Table 1, steady state and stability analysis is applicable for the P5 event and the P8 event. The implementation of the P5 event and the P8 event in steady state analysis will likely be identical for both of these events (since fault type usually is not considered). However,

- for P5, Non-Consequential Load Loss is not allowed for EHV facilities.
- For P8, Non-Consequential Load Loss is allowed for EHV facilities.

This is a possible contradiction that should be reviewed and clarified.

Comment

The proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report listed as one alternative the elevation of the P8 type events 'to a planning event with its own system performance criteria' (Joint Report, ***Chapter 2 – Alternatives***, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that "***Probability of three-phase faults with a protection system failure is low enough that it does not warrant a planning event***". The creation of the proposed P8 event in this version has clearly overlooked this fact.

The Joint Report does agree that there is *"the existence of a reliability risk associated with the single points of failure in protection system that warrants further action"* (We agree with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, ***Chapter 3 – Conclusion***, pg 11). Accordingly, the SAR has defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which would include the P8 event.

Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5.

Suggestion: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

CenterPoint Energy Houston Electric, LLC ("CenterPoint Energy") does not agree with the creation of the proposed P8 event. A three-phase fault plus delayed fault clearing due to the failure of a non-redundant component of a Protection System in one event is a very rare occurrence in power system disturbances, beyond the scope of a planning event, and therefore should be considered an Extreme Event. As an alternative to the creation of a proposed P8 event, CenterPoint Energy recommends modifying the Extreme Event requirement, as proposed in the approved SAR, to expressly require evaluation of a three-phase fault and Protection System failure.

TVA supports JEA's comments. We believe a three-phase fault including protection system failure would have an extremely low probability of occurring. Requiring implementation of actions to prevent these extremely rare events would cause a large and unnecessary financial burden with little benefit to our system reliability.

We believe the proposed three-phase analysis is duplicative to Category P5 events that study single-phase-to-ground fault types. While three-phase faults can be more severe, the probability of such events are less likely to occur. This could set a precedence requiring PCs and TPs to include other less likely events in their future studies, or held accountable otherwise. We recommend removing this proposed event from the standard and provide registered entities an opportunity to individually address, on their own and not required through this standard, the concerns to BES reliability raised during the FERC Technical Conference, recommendations from various NERC Technical Subcommittees, and the efforts of this SDT.

Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - SPP RE, Group Name SPP Standards Review Group

Answer	No
Document Name	

Comment	
The SPP Standards Review Group considers the proposal to cateogorize the P8 event as a Planning Event as going beyond the scope of the Federal Energy Regulatory Commission's (FERC) Order No. 754. The FERC order requires that NERC review how single points of failure on protection systems are studied and identify additional actions necessary to address the matter; however, Order 754 does not require a Corrective Action Plan (CAP) to be developed or implemented. *See* Order No. 754 at PP 19-20. By re-categorizing P8 events as a Planning Event, rather than an Extreme Event, the proposed standard would require the TP to prepare a Corrective Action Plan in accordance with Section 2.7 *et seq.* of TPL-001-4. Summarily, the proposed revision presents a requirement not specifically defined by FERC. Moreover, the proposal to categorize P8 contigencies as Planning Events conflicts with the SPCS (System Protection and Control Subcommittee) and the SAMS (System Analysis and Modeling Subcommittee) recommendations contained in its Order No. 754 assessment (Joint Report). The SPCS and SAMS advised that P8 events should remain categorized as an Extreme Event and that "[probability] of a three-phase fault with a protective system failure is low enough that it does not warrant a planning event." *See* Joint Report at 9 and 11. Recommendations: 1. Remove the P8 event from the proposed language. The occurrence of this type of event is rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 subrequirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This subrequirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concerns, recommendations from the Joint Report, and satisfy the objective of the SAR, regarding the single points of failure in Protection Systems. 2. Should the drafting team decide to categorize a P8 contingency as a Planning Event, the drafting team should consider expanding the applicability of the standard to include those functional entities from which the Transmission Planner (TP) must receive system protection data: Generator Owner (GO), Transmission Owner (TO), and Distribution Provider (DP). Because a non-vertically integrated Planning Cooridnator (PC) or TP (e.g., an RTO/ISO) must receive and coordinate system protection data from the GO, TO, and DP in order to satisfy the planning requirements, the standard should be revised to include data submission requirements for the GO ,TO, and DP. The proposed standard's reliance on MOD-032 as a means to receive system protection data is insufficient because MOD-032 does not specifically require such data be provided to the TP.

Comment	
The focus of the contingencies must be on the likelihood of them happening. P8 contingencies consist of a three-phase fault plus non-redundant component of a protection system failure to operate. Oncor's transmission system experiences very low instances of three-phase faults as compared to single-phase faults. In addition, a three-phase fault with non-redundant component of a protection system failure to operate is even more rare. The likelihood or probability of a P8 contingency occurring is so low that Oncor believes it would not be practical both from an engineering and economical standpoint to elevate this event to a P level contingency. It better fits in the extreme event category.

We agree with the creation of the proposed P8 event. However, in our view, following a P8 event the tripping of a circuit due to a generator pulling out of synchronism should be permissible as long as it doesn't result in cascading or uncontrolled separation. The proposed standard requires that for the P8 planning event, "The System Shall remain stable" and "Cascading and uncontrolled islanding shall not occur". However, since, there isn't a common understanding of what the system remaining stable means, we suggest including the following sub-requirement in the standard for additional clarity:

4.1.4. For planning events P8: When a generator pulls out of synchronism in the simulations, the resulting apparent impendace swings shall not result in Cascading.

Alternatively, a similar clarification as our proposed sub-requirement 4.1.4 can be added to Condition (a) on top of Table 1 as follows:

a) For P0 through P7 events, the System shall remain stable, and Cascading and uncontrolled islanding shall not occur. For P8 event, Cascading shall not occur.

Yes. We agree with adding the proposed P8 event with the understanding that Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES, then if needed, the corresponding SLG fault contingency. More specifically, the need to simulate a subsequent SLG fault of the corresponding contingency would be only if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss or Cascading. It is also expected that there will be “extremely few,” or more likely “no”, SLG fault contingencies that would result in more severe impacts than the corresponding 3-phase fault contingencies. Please see comment for Footnote 14 in the responses to Question 4. It is difficult to ascertain the simulation performance requirement for P8 events. To help clarify these performance requirements for the proposed P8 events, suggest inserting R4.1.4 that reads: For planning event P8, the System shall remain stable, and Cascading and uncontrolled islanding shall not occur.

Comment	

The proposed revisions to the Steady State and Stability performance requirements in Table 1 imply that a P8 event must not result in Cascading, instability, and islanding. This exceeds the SDT’s original intent to require development and implementation of a CAP to avoid Cascading only.

To remove the performance requirements for instability and islanding for a P8 event, ERCOT suggests the following wording changes to Condition (a):

(a) For P0 through P7 events, the System shall remain stable, and Cascading and uncontrolled islanding shall not occur. For P8 event, Cascading shall not occur.

CHPD appreciates the effort of the SDT to address the directives from FERC Order No. 786, and the recommendations in response to Order No. 754 from the SPCS and the SAMS regarding the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request ("Joint Report")).

Indeed, the primary goal of the Standards Authorization Request (SAR) is to implement the recommendations in the Joint Report. However, the Joint Report states that "***probability of three*** ***-phase fa*** ***event.***" As such, we believe that the proposed addition of the P8 planning event is overreaching and beyond the scope of the SAR.

The Joint Report does acknowledge *"the existence of a reliability risk associated with the single points of failure in protection system that warrants further action"* and therefore recommended additional emphasis in planning studies to assess three-phase faults involving protection system single points of failure (Joint Report, ***Chapter 3 – Conclusion***, pg. 11). Accordingly, the SAR defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event falls outside the scope of the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan (CAP) if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which includes the P8 event.

With the exception of the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5.

The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address FERC's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

2. Do you agree with the changes to TPL-001-4 Requirement 1, Part 1.1.2, in order to meet the FERC directive in Order No. 786?

Teresa Cantwell - Lower Colorado River Authority - 5	
Answer	No
Document Name	
Comment	
This change appears to require the creation of a model for every outage, without regard for the length of the outage. The requirement is already part of the performance standard through the application of P5 contingencies. The revision as proposed would require a proliferation of cases be developed and maintained and lead to confusion about which case to use. The development of cases for known outages seems appropriate for the operational time horizon but impracticle for the long-term planning time horizon. Reliability of the system during outages in the long-term planning horizon can be studied appropriately through the development of contingencies accompanied with appropriate generation adjustments to be applied to individual known outages within the seasonal period defined by a planning case as opposed to developing a seperate case for each combination of known outages. Further, the changes proposed under 2.1.3 create confusion around which P1 events need must be studied.

The SPP Standards Review Group recommends the drafting team add clarifying language to subparts 2.1.3 and 2.4.3 that specifies how the PC and TP should assess and perform the required studies.

Recommendation:

The following revised language for subparts 2.1.3 and 2.4.3 will provide clarity and eliminate ambiguity how analysis is performed with respect to the subparts previously mentioned (see as follow):

Subpart 2.1.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the Bulk Elextric System (BES), with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, ***as selected in Part 2.1.1 and 2.1.2***, when known outages are scheduled."

Subpart 2.4.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, ***as selected in Part 2.4.1 and 2.4.2***, when known outages are scheduled."

We believe the proposed change should be simplified as a procedure or technical rationale that identifies what is a known outage should not be embedded within this requirement. The requirement focuses on maintaining system models, not developing procedures or technical rationales. These models must be based on data consistent with NERC Reliability Standard MOD-032-1, Corrective Action Plans, and other data sources. We recommend the SDT follow the acceptable approach suggested within the FERC directive that identifies significant planned outages can be based on registered entity-selected facility ratings or other parameters for inclusion within system models.

CenterPoint Energy believes the language in Requirement R1.1.2 could lead to confusion as to which outages are required to be studied. FERC Order 786, paragraph 43 identifies "decreasing the outages to fewer months to include additional significant planned outages" as an acceptable approach. CenterPoint Energy recommends the SDT reconsider this approach and identify a 3-month threshold to capture the outages over which FERC was concerned.

We agree with removing the Reliability Coordinator from this standard as the responsibility of the RC is "operation" of the system. Also, we believe that using an established procedure or technical rationale to potentially idenifty outages is a step in the right direction.

The concept of known or planned outages in TPL-001-5 needs to have a footnote or further explanation to clarify that this applies to "outages needed to execute the CAP" and be very specific. Also, long term planned generation outages may need to be included. However, maintenance outages should not be addressed in this TPL standard. Maintenance outages are typically not known much more than 6 months out and are assessed by Operations Planning, under TOP and/or IRO standards, closer to the desired time of the maintenance outage such that expected system conditions reflected in the study power flow is better known. Furthermore, since the "Near Term Planning Horizon" covers year 1 through 5, and maintenance outages are not scheduled this far out, then maintenance outages should be not be included in this standard. As such, the exclusion of maintentnace outages for this assessment should be stated in the standard.

Therefore, we recommend that 1.1.2. be modified as follows:

1.1.2 Known Expected outages of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Outage(s) shall be selected according to an established process or technical rationale that, at a minimum:

1.1.2.1 Considers any extended outages(s) that are expected during the implementation of identified Corrective Action Plans

1.1.2.2 Considers long term planned generation outages (outside of normal planned and scheduled maintence outage)

1.1.2.4 Does not exclude known transmission outage(s) soley based on the outage duration

Texas RE appreciates the Standard Drafting Team's (SDT) continuing efforts to develop a workable definition to implement the Federal Energy Regulatory Commission (FERC) directive in FERC Order No. 786 to include planned maintenance outages of significant facilities in future TPL-001 planning assessments and eliminate the previous six-month bright line inclusion criterion. Texas RE particularly appreciates the SDT's reconsideration of developing a significant outage test based solely upon outages "selected in consultation with the Reliability Coordinator." However, Texas RE remains concerned that the current draft TPL-001-5 R1.1.2 language, if adopted, would be unworkable. Rather than the SDT's proposed approach, Texas RE instead recommends that the SDT require Transmission Planners (TP) and Planning Coordinators (PC) to identify and model known outages selected in accordance with an established procedure that (1) requires selection based on the MW or facility rating criteria identified by FERC in FERC Order No. 786; (2) provides a technical justification for the specific MW and facility rating threshold selected; and (3) does not exclude known outage(s) solely based upon the outage duration.

Texas RE's principal concern with the proposed TPL-001 language, as currently drafted, is that is appears circular. In particular, the proposed TPL-001-5 R1.1.2 first provides that planning models shall represent "[k]nown outages of generation or Transmission Facility(ies) . . . selected for analyses pursuant to Requirement 2, Parts 2.1.3 and 2.4.3 only." That is, the proposed TPL-001-5 R 1.1.2 appears to limit the scope of modeling requirements to a subset of analyses previously identified in TPL-001-5 R 2.1.3 and 2.4.3. TPL-001-5 R 2.1.3 in turn provides that qualifying studies shall include "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2." That is to say, the proposed TPL-001-5 R 1.1.2 appears to reference significant outages identified in the qualifying studies in TPL-001-5 R 2.1.3 while the required qualifying studies in TPL-001-5 R 2.1.3 will be based on those known outages identified in the established procedure set forth in TPL-001-5 R 1.1.2. As a result, the proposed language appears circular. That is, TP or PCs will not know which outages to select for their qualifying studies prior to identifying them using their established procedure. However, that procedure itself depends upon a prior identification of known outages in the qualifying study model run.

A similar issue exists in the proposed TPL-001-5 R 2.4.3. This section again requires studies of "P1 events . . . with known outages modeled as in Requirement R1, Part 1.1.2." However, will likely only be able to identify "known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events when concurrent with selected known outage(s)" by performing the analysis in TPL-001-5 R 2.4.3.

In lieu of adopting what appears to be a confusing and circular approach, Texas RE instead recommends that the SDT consider FERC's explicit invitation to define significant known outages based on parameters other than duration. In particular, FERC noted that NERC and the SDT could develop "parameters on what constitutes a significant planned outage based, for example, on MW or facility ratings." (FERC Order No. 786, P. 43). The SDT could implement such a directive by requiring TPs and PCs to select known outages according to an established procedure or technical rationale that, at a minimum, establishes criteria based on MW or facility ratings for significant known outages. Consistent with this approach, the SDT recommends considering revising the proposed TPL-001-5 R 1.1 along the following lines:

1.1 System models shall represent:

1.1.1. Existing Facilities;

1.1.2. Known outages(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1 Establishes a criteria, supported by a technical justification, for identifying significant known outages based on MW or facility ratings; and

1.1.2.2. Does not exclude known outage(s) solely based upon the outage duration.

Additionally, it is unclear whose "established procedure" per Part 1.1.4 is to be used, so additional clarification would be helpful.

National Grid would like to express our appreciation and supports the direction in which the TPL-001-5 SDT is proposing to adjust the NERC Reliability Standard TPL-001 and provides the following comment for consideration: Generation or Transmission Facilities outages can be scheduled on a time scale shorter than the Near-Term Transmission Planning Horizon. If a Facility outage previously not studied is selected per guidance provided in R1.1.2 and the selected Facility outage occurs within the Near-Term Transmission Planning Horizon, would that prohibit use of past studies to support the annual Planning Assessment (as otherwise allowed per R2.6)?

In the last sentence of R1.1.2., SRP recommends changing the word “each” to “all” for the sake of clarity. Also, it is not necessary to specifically list sub-part 1.1.2.2., as there are already other criteria listed which are not solely based on outage duration.

We have two concerns with the proposed changes: • As currently proposed, the TPL standard only requires P1 events to be simulated when assessing planned outages in the Near-Term Transmission Planning Horizon. However, this is inconsistent with NERC FAC standard FAC-014-2 R6, which require the Reliablity Co-ordinator to consider multiple contingencies when assessing these outages. Therefore, at a minimum, when the Planning Co-ordinator is assessing planned outages occurring in the Near Term Transmission Planning Horizon, they should simulate the contingences that the Reliablity Co-ordinator would simulate when assessing and approving these outages. Hence we propose to replace the requirement to simulate P1 events in R2.1.3 and R2.4.3 with a requirement to simulate the contingencies as specified per R6 of the current FAC-014-2 standard.	

- The current proposed requirement for selecting outages does not completely address FERC's order. FERC's order mentions that planned outages should not result in 'the loss of non-consequential load or detrimental impacts to system reliability', whereas the current proposed approach only addresses the loss of non-consequential load.

We propose the following changes to Part 1.1.2, "Known outage(s) of generation or Transmission Facility(ies) planned to occur in the Near-Term Transmission Planning Horizon for applicable system conditions and year(s) selected by the Transmission Planner or and Planning Coordinator for analyses . . .":

- We suggest replacing the term, "scheduled", with the words, "planned to occur", because the term "scheduled" can be misinterpreted to apply only to outages that are approved and scheduled by Reliability Coordinators. On the other hand, the word "planned to occur" can refer to outages that TPs and PCs know need to be assessed in the planning horizon to implement identified Corrective Action Plans and Facility rebuilds, or know may be difficult or impossible to schedule in the operating horizon without the risk of exceeding System Operating Limits or risk of Non-Consequential Load Loss.

If the term "scheduled" is not replaced and is interpreted to apply only to outages that are approved and scheduled by Reliability Coordinators, then the NERC proposed Part 1.1.2.1 should be removed because Reliability Coordinators only approve scheduled outages in the planning horizon after they assessed for acceptable reliability impact for the applicable system conditions of the outage. So, there is no need to require Planning Coordinators and Transmission Planners to duplicate the assessment of the Reliability Coordinator's scheduled outages.

- We suggest adding, "for applicable system conditions and year (s)", to make clear that the selected outages are related to specific timeframes and are for real applicable system conditions.

- We suggest replacing "Transmission Planner and Planning Coordinator" with "Transmission Planner or Planning Coordinator" because each entity may have valid documented procedures or technical rationale for selecting appropriate outages that differ due to their specific perspectives and roles.

We propose replacing Part 1.1.2.1 with previous proposed wording of, "Are selected in accordance with documented outage selection procedures or technical rationale". If this wording in not added to Part 1.1.2.1, then Part 1.1.2.1 is not a selection limiting criteria. All known outages would have to be evaluated to determine whether any of them are expected to result in Non-Consequential Load Loss for P1 events in Table 1. And since all known outages were studies, then Part 2.1.3 and Part 2.4.3 would have already been performed without any known outage selection limitations.

Furthermore, the proposed Part 1.1.2 text does not address FERC's directive for "NERC to modify Reliability Standard TPL-001-4 to address the concern that the standard could exclude planned maintenance outages of significant facilities from future planning assessments…" [FERC Order 786, Final Rule, Item 3, page 5; Planned Maintenance Outages, pp. 29-37].

Comments: Addressing Order 786 without adding a tremendous amount of unnecessary study work is admittedly a difficult problem to solve. FMPA does not support the current draft language because it effectively requires that all outages, regardless of the duration, size or location of the facility (really regardless of any qualifier) must be studied. The reason for this is that non-consequential load shedding is rarely possible to identify without running the power system simulations. Thus in order for an entity to only study outages that cause non-consequential load shedding, that entity usually has to have already studied those outages. The suggested “filter” that the SDT is proposing requires that the Planner already know the result of the simulations. The proposed language introduces a standard requirement that, in practice, will result in entities being forced to “prove the negative” – that is, the focus will become defending how the Planner knew that certain outages would not cause non-consequential load loss. FMPA asserts that some reasonable qualifiers must exist, and must be used in an attempt to avoid requiring entities to prove the negative. Furthermore, conducting Planning studies on very short duration outages is a waste of time since short duration outages are much more easily (and therefore almost always are) rescheduled in the operations horizon to avoid transmission system reliability risks that are possible. Focusing on longer outage durations increases the likelihood that system performance conditions observed in the studies might actually occur in real time and focuses the study work of the planners more on projects that increase the flexibility of the system (e.g. giving the Operators more tools in their toolbox), rather than on trying to guess at operations horizon conditions or emulate Operations horizon planning work.

Duke Energy disagrees that the proposed changes meet the directives. The changes go beyond the scope of changes directed in Order No. 786 and will make Planners responsible for evaluating all known scenarios, even outages of limited duration (e.g. 10 minutes?). Also, the standard lacks clarity on whether outages of a Protection System should be considered as well. The lack of specificity regarding outages of limited duration, requires a Planner to study almost every possible scenario Operators may face in the Near Term Planning Horizon. Further, the proposed changes appear to push the standard to a fill in the blank status because it simply requires creation of “an established procedure”. The changes to 2.1.3 and 2.4.3 in addition to 1.1.2 appear to create circular logic to require Planners to know the seriousness of the consequences of a scenario they have yet to study.

We propose the following changes to Part 1.1.2, “Known outage(s) of generation or Transmission Facility(ies) planned to occur in the Near-Term Transmission Planning Horizon for applicable system conditions and year(s) selected by the Transmission Planner or Planning Coordinator for analyses . . .”:

- We suggest replacing the term, “scheduled”, with the words, “planned to occur”, because the term “scheduled” can be misinterpreted to apply only to outages that are approved and scheduled by Reliability Coordinators. On the other hand, the word “planned to occur” can refer to outages that TPs and PCs know need to be assessed in the planning horizon to implement identified Corrective Action Plans and Facility rebuilds, or know may be difficult or impossible to schedule in the operating horizon without the risk of exceeding System Operating Limits or risk of Non-Consequential Load Loss.

If the term “scheduled” is not replaced and is interpreted to apply only to outages that are approved and scheduled by Reliability Coordinators, then the NERC proposed Part 1.1.2.1 should be removed because Reliability Coordinators only approve scheduled outages in the planning horizon after they assessed for acceptable reliability impact for the applicable system conditions of the outage. So, there is no need to require Planning Coordinators and Transmission Planners to duplicate the assessment of the Reliability Coordinator’s scheduled outages.

- We suggest adding, “for applicable system conditions and year (s)”, to make clear that the selected outages are related to specific timeframes and are not ‘hypothetical’ outages.

- We suggest replacing “Transmission Planner and Planning Coordinator” with “Transmission Planner or Planning Coordinator” because each entity may have valid documented procedures or technical rationale for selecting appropriate outages that differ due to their specific perspectives and roles.

We propose replacing Part 1.1.2.1 with previous proposed wording of, “Are selected in accordance with documented outage selection procedures or technical rationale”. If this wording in not added to Part 1.1.2.1, then Part 1.1.2.1 is not a selection limiting criteria. All known outages would have to be evaluated to determine whether any of them are expected to result in Non-Consequential Load Loss for P1 events in Table 1. And since all known outages were studies, then Part 2.1.3 and Part 2.4.3 would have already been performed without any known outage selection limitations.

Furthermore, the proposed Part 1.1.2 text does not address FERC’s directive for “NERC to modify Reliability Standard TPL-001-4 to address the concern that the standard could exclude planned maintenance outages of significant facilities from future planning assessments…” [FERC Order 786, Final Rule, Item 3, page 5; Planned Maintenance Outages, pp. 29-37].

The changes meet the FERC directive but is restrictive on the transmission Planner/Planning Coordinator. In TPL-001-4, only outages 6 months or greater in the Planning Horizon needed to be considered. Requirement R1.1.2.2, as now written, does not permit exclusion solely based on outage duration, which means even one day or one hour outages that are in the near-term Planning horizon cannot be excluded. Perhaps the drafting can consider permitting exclusion of known outages based on some minimum duration (eg. outages less than 1 month maybe excluded, outages between 1 and 6 months may only be excluded if they are not expected to result in non-consequential load loss for P1 events, all outages greater than 6 months shall be included). This makes expectations more clear and avoids the need to develop a technical rationale.

NVE recommends that R1.1.2 be modified to include outages that span the season being studied. For outages in the season being studied that are less than the entire span of the season, the Transmission Planner should be able to select which outage to study based on when in the study season the outage is to occur and the significance of the generation or transmission facilities involved in the outage for the area of the system they are located in.

OG&E recommends the drafting team add clarifying language to subparts 2.1.3 and 2.4.3 that specifies how the PC and TP should assess and run the required studies.

Recommendation:

The following revised language for subparts 2.1.3 and 2.4.3 will provide clarity and eliminate ambiguity how analysis is performed with respect to the subparts previously mentioned (see as follow):

Subpart 2.1.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the Bulk Elextric System (BES), with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, **as selected in Part 2.1.1 and 2.1.2**, when known outages are scheduled."

Subpart 2.4.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, **as selected in Part 2.4.1 and 2.4.2**, when known outages are scheduled."

Comments: Other options could better address concerns in the FERC directive order No 786. The requirement to study outages of any duration in the Near Term Planning Horizon creates burden on the planning process to address the scheduling of outages rather than adequacy of BES infrastructure. Transmission planning is expected to determine performance deficiencies of the system and to mitigate them with planning solutions. Studying impacts of outages with 2 independent unplanned events on top of it would require the creation of additional base cases for (1) each outage in the 1-5 year horizon, or (2) creating cases which encompass all anticipated outages in a season. Next, one would then need to perform all analyses on top of such outages that would be included in the base cases. This essentially creates another layer of contingency analysis which can result in selective N-1-1-1 or more events deep depending on the method used. The results would likely be that impacts could be mitigated by: (a) scheduling appropriately to ensure outages do not overlap, or (b) moving outages into different seasons.

Unintended consequences could result. One example, although unlikely, would be proposing the construction of a transmission project that is built to allow for an outage of a facility for maintenance/rebuild which may be a rare outage occurrence itself. This project just adds a selective 3rd layer of transmission redundancy to the system to allow for reliable system operation during an outage if up to 2 other unplanned events occurred. While this exercise may be of importance to the scheduling of outages and identification of impacts of outages and contingencies, it is best handled by operations planning (operating horizon) which should instead handle the study and scheduling of planned outages beyond the operating horizon and into the Near Term Planning.

Alternative Draft wording for Requirement 1, Part 1.1.2 is provided below.

1.1.2. Known outage(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1. Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with the selected known outage(s);

1.1.2.2. Considers outage duration(s) but does not exclude known outage(s) solely based upon their duration;

1.1.2.3. Considers the significance of the generation and Transmission Facility(ies) involved in the known outage(s) for the area of the system in which they are located; and

1.1.2.4. Considers the expected load levels during the known outage(s).

Comment

NIPSCO believes any potential issues associated with planned maintenance outages are best identified through operational studies such as real time, next-day, and seasonal analysis rather than through the annual TPL-001-4 system performance analysis. Planned maintenance outages are almost always of short duration and are commonly scheduled to avoid occurrence during critical peak seasons. Only planned maintenance outages which are reasonably expected to occur during critical peak seasons, such as those six months or longer, should be included in the annual TPL-001-4 system performance analysis.

Removing the existing six month threshold for planned maintenance outages and continually reducing the time of duration requires the analysis of an ever greater number of concurrent generator and line outages beyond any specified in the TPL-001-4 standard including (P2) bus+breaker fault, (P4) stuck breaker, and (P7) common tower. This moves the performance analysis requirements of the TPL-001-4 standard closer to an effective N-2 requirement, which is currently an Extreme event, which was never intended.

R1.1.1.2 requires planners to include known generation and transmission facility outages scheduled within the Near-Term Transmission Planning Horizon and to select the outages studied according to an established procedure or technical rationale. The requirement also states that outages should not be excluded solely based on outage duration. FERC Order 786 states that acceptable approaches for addressing the outage concern include decreasing the threshold to fewer months or including parameters for identifying “significant planned outages” (page 33).

Planners should review planned outages for the season under study and use technical rationale to determine whether an outage should be included or excluded from the study. Per FERC Order 786, planners should have the flexibility to exclude outages based on their technical rationale. Outages not deemed significant for the TPL assessment will be included in operations studies as the outage approaches.

CHPD has three concerns related to this proposed language regarding known outages in R1.1.2.:

1. The nature of the outage, i.e. scope of work, has an effect on the system but the transmission planners do not necessarily know how a facility will be removed from service. For example, for maintenance of a relay system, there are many options for performing the maintenance with impacts ranging from delayed clearing to no system impact at all: 1) simply take the maintenance outage with all other systems energized (relying on delayed clearing); 2) take the local terminal out of service (likely eliminating the delayed clearing risk); or 3) bypass the normal breaker and relays and feed the line from a bus tie or transfer breaker. CHPD requests the standard provide coordinators with flexibility to assume the scope and nature of outages.

2. For overlapping, un-coordinated outages, the Planning Authority or Transmission Planner should be given authority to, when appropriate, move the outages for the purposes of the planning study so they do not overlap. This activity is frequently performed for outages in the Operations Timeframe, but no construct exists to do this for outages in the Planning Horizon. The proposed Standard should provide such a construct.

3. For situations in which new infrastructure for a Corrective Action Plan cannot be built prior to an outage, e.g., an outage scheduled in 1.5 years requires a capital project that will take 3 years to build, the proposed Standard should allow for the interruption of firm transmission service. FERC’s concern was that properly planned outages should not lead to load shedding. FERC Order 786, paragraph 41. Allowing for interruption of firm transmission will allow critical outages to be taken while avoiding non-consequential load loss.

These are planning studies, not operating studies. Outage coordination studies are currently done by the operations department as part of operations seasonal planning. Adding outage coordination studies to the Near Term Planning Horizon [1-5 years] will increase the planning work load without any real reliability improvement. The reason being that planned outages are currently part of transmission planning in both the Near and Long Term Horizons. It is a matter of understanding the steady-state contingency results. When looking at future system behavior, N-2 steady-state contingency analysis will reveal system performance with a single BES element out of service followed by a P1 event. Two element are out of service N-2. This is only a starting point. When N-2 contingency analysis does not show any performance violations, the system should be able to remove BES elements from service without issue. If a performance violation is found, then further analysis is required (N-1-1). We do not need a new requirement.

If the requirement is added, the stability portion should be removed. Including stability analysis to the requirement will make it overly burdensome and will not improve reliability. Stability analysis software is not well suited for automation and the TPs and PCs can not reasonably be expected to perform stability analysis for every valid P1 contingency for each possible BES outage. The language of the requirement calls for contingencies which are "expected to produce more serverer system impacts". The only way to know the expected stability impact is to study it. Therefore, the requirement actually requires all planned outages to be studied using stability analysis and then to use those results to support the selection of a contingency subset to be studied. This is a circular argument. Stability analysis of planned is not needed for reliability.

Sergio Banuelos - Tri-State G and T Association, Inc. - 1,3,5 - MRO,WECC	
Answer	No
Document Name	

Comment

Tri-State partially agrees but has some reservations regarding the specific language and overlaps with existing P3 and P6 contingency categories.

Requirement 1.1.2.2 runs counter to Requirement 1.1.2 which allows outage selection based on technical rationale. Technical rationale would include time-dependence. The inclusion of major outages regardless of time duration effectively adds an outage coordination aspect to performing the TPL assessment. Outage coordination is already performed by Transmission Operations.

Requirement 1.1.2 effectively describes a category P3 or P6 contingency.

AZPS respectfully asserts that the proposed criteria under Requirement R1, Part 1.1.2 presents an overly complicated response to the Commission's directive in Order 786, Paragraph 43. Specifically, the Commission's directive allowed for the response to the directive to be a simple reduction of the 6 month time period. Such reduction would provide objective criteria for the entire industry to utilize to determine whether or not planned outages should be included in their planning assessment. AZPS is concerned that the proposed criteria under Part 1.1.2 is subjective in nature and could result in the potential for inconsistency relative to the inclusion of outages in planning assessments, e.g., outages of three (3) months or less could be implicated by some entities despite such outages creating unnecessary study burden with little to no reliability benefit wherein other entities could exclude such short-term outages.

To ensure that the criteria provides more objectivity relative to the inclusion of outages in planning assessments, which would increase the overall consistency and value of planning assessments generally, AZPS recommends that the SDT reconsider the currently proposed criteria and replace it with criteria that requires outages to be included where such outages meet a definitive time period of "more than 3 months." AZPS respectfully asserts that short term outages should be studied and prepared for in the Operating horizon and not in a planning assessment and, further, that the potential for inconsistency between planning assessments would reduce the proposed reliability benefit anticipated by the currently proposed criteria. For these reasons, AZPS recommends replacement of the currently proposed criteria with a simplified criteria requiring inclusion of outages that are anticipated to last more than three months.

BPA appreciates that the reference to consultation with the Reliability Coordinator has been removed and that "Transmission" was added to Near-Term Transmission Planning Horizon.

For R1.1.2.2 BPA does not believe it would be reasonable to require justification for every known outage that is not included. The way R1.1.2 is written, it seems to imply that an outage excluded based on duration should also not meet the established procedure or technical rationale.

The language in Part 1.1.2 is fine; however the language added to R2 Parts 2.1.3 and 2.4.3 that is referenced in Part 1.1.2 is confusing. Page 8 of the posted Technical Rationale document contains the rationale for changes to R2 Parts 2.1.3 and 2.4.3:

"Consistent with FERC's directive, the drafting team modified Requirements **R2 Parts** 2.1.3 and 2.4.3 to further recognize the intent to limit required study to only those known outages that are expected to produce severe System impacts on the PC/TP's respective portion of the BES."

LSPT agrees with this rationale. However, the changes to Parts 2.1.3 and 2.4.3 do not accomplish this objective. Since both 2.1.3 and 2.4.3 have the same added language, the concern is illustrated in 2.1.3 only, which states the following regarding the analysis required by the Planning Coordinator or Transmission Planner, with the added language bolded:

2.1.3. P1 events in Table 1 **expected to produce more severe System impacts on its portion of the BES**, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

The proposed change allow the PC/TP to **not** evaluate all P1 events; the PC/TP must only evaluate those P1 events in Table 1 "expected to produce the most severe System impacts on it portion of the BES." In other words, the P1 events in combination with "known outages" that produce the most severe System impacts may be a different set of P1 events..

LSPT's proposed changes to 2.1.3 (and correspondingly to 2.4.3) will correct this unintended consequence:

2.1.3. P1 events in Table 1, with known outages **that are expected to produce more severe System impacts on its portion of the BES** modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

OUC believes the proposed Requirement 1.1.2. leaves too large of ambiguity in what needs to be tested. The intent of what is required to be tested is not clear, and appears on the surface to overlap significantly with the Operations Planning realm. The current standards provide enough parameters to include outages into the base case (using the 6 month outage duration as a threshold). The proposed changes reads as if it's requiring long-term transmission planners to study operational planning studies under the "Near-Term Transmission Planning Horizon". OUC does not believe the TPL requirements should include operational planning studies that should otherwise be included under the TOP standards (i.e. TOP-002-4). By not defining an outage duration, the requirement now appears to welcome any and all outage scenario testing, which should otherwise be completed under the TOP standards. Although Requirement 1.1.2.1 was added to limit the outages selected, for most it would be unclear what scenarios would result in non-consequential load loss, thus not providing enough of a parameter to limit the outages needed to be tested.

Suggestion: OUC would suggest keeping the outage length as a parameter in order to filter the outages that should be studied in the Near-Term Planning Horizon. In understanding the 6 month outage duration not being inclusive of what the drafting team may be looking for, perhaps limiting the outage duration to 3 months would include enough of the key outages that should be studied, while not including all outages which would otherwise need to be analyzed under Operations Planning scenarios.

As proposed, we believe that R1.1.2.1 involves the creation of hypothetical outages to evaluate and include in the transmission assessment.

From the Order 786, paragraph 42, "The Commission's directive is to include known generator and transmission planned maintenance outages in planning assessments, not hypothetical planned outages." Most transmission maintenance outages are scheduled in the operating horizon, after considerable review and analysis of expected system conditions in the operating horizon. These outages may be daily, weekly, or of longer duration, but still they are planned and scheduled in the operating horizon and not the planning horizon. Therefore, from a planning perspective, few if any transmission outages will be included in the base case peak or off-peak models for analysis and development of the Planning Assessment because these maintenance outages have not been scheduled in the planning horizon.

The Commission goes on to state in paragraph 44 that "these potential planned outages must be addressed, so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon". In other words, the Commission wants us to speculate on the start and stop times of the maintenance outages, effectively creating hypothetical outages to consider for analyses. From our perspective the language of this paragraph of Order 786 is ambiguous.

The Commission also stated in paragraph 44 that category P3 and P6 contingencies do not cover generation and transmission maintenance outages, but during the webinar, it was suggested by a member of the standard drafting team that the allowance of system adjustments following the planning maintenance outage event was the reason for FERC's disapproval. Is it the drafting team position that if the analyses were performed without system adjustments between the outage events, then FERC would not object? We did not read that response in Order 786 and request that the Standard Drafting Team provide reference that analyses of P3 and P6 events without system adjustment, other than make-up power, would provide an acceptable method for determining system adequacy during maintenance, planned or hypothetical, outages. However, we question why generation redispatch or other operating guides cannot be developed, if needed, to facilitate the performance of maintenance outages in the planning or operating horizons.

Requirement 1, Part 1.1.2.1., does not provide a clear demonstrable criterion for outage selection. In order to conclusively determine “expected” Non-Consequential Load Loss during an N-2 event, studies must be performed to determine the response of the system. Therefore, this requirement, as written, implies that the Transmission Planner must consider *all* known outages. In Order 786, paragraph 43, FERC suggested that a selection

parameter of facility ratings could be used. Use of a facility rating threshold in the standard would provide needed clarity to Transmission Planners and result in greater consistency.

3. Do you agree with the proposed implementation plan?

Joe McClung - JEA - 3,5 - FRCC, Group Name JEA Voters	
Answer	No
Document Name	
Comment	

The 36-months period for the proposed standard to become effective seems to be adequate along with an additional 24-months period for the development of CAP for the newly identified issues only with new P5.

However, we do not agree with the overall Implementation Plan. The P8 event proposal is out of scope based on our response for Q1. Therefore, JEA does not agree with the development of CAP for P8 either. There should not be a performance requirement for an extreme event and hence no CAP needs to be mandated. If the analysis for the extreme events with the clarified Footnote 13 with the single points of failure concludes there is Cascading, the PCs and TPs shall conduct an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences. This is already required today for compliance with the Requirement R2 sub-requirement 4.5 of TPL-001-4. Any development of CAP and its implementation plan for such an extreme event should be at the discretion of the individual entities.

We agree with the performance requirements for the updated P5 event. However, we do not agree with the 96-months period to meet the performance requirements for the newly identified issues with the proposed P5 events. As the SDT has acknowledged, the only way to meet the performance requirements for P5 events with single points of failure in Protection System will mostly be a capital improvement project to be installed at the identified substation(s). Even though performing the studies/analyses and the development of CAPs are within PCs' and TPs' control, they do not have any control in implementing the CAPs. The amount of capital improvement budget available, the outage coordination amongst various parties (GO, GOP, TO, TOP, system operators and even RCs), project scheduling as well as the availability of manpower to actually implement the CAPs at the substations with a sudden influx of work outside the routine job are numerous facets of the project implementation beyond the control of PCs and TPs. The size of the utility and the number of CAPs to be implemented can create additional different challenges for different types of utilities such as co-ops, municipals, IOUs etc. in different regions/markets (ISO/RTO/vertically integrated etc.)

Suggestion: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, JEA recommends for NERC to survey the industry (PCs, TPs and Facility owners) with another **Request for Data Under Section 1600 of the NERC Rules of Procedure** for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual **ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP)**.

Based on our preliminary review and our existing resources, the amount of time needed to develop new contingencies and perform new studies for new 'known outages' and 'non-redundant' Protection System components requirements will require substantially more time than the 36-month timeframe proposed in the implementation plan. So, we propose that the 36-month timeframe to perform these tasks be extended to a 60-month timeframe.

Duke Energy does not agree with the proposed Implementation Plan. Depending on system conditions, it is anticipated that when using Dynamic Load Modeling, that an entity could see a great number of its Facilities fail the performance requirements. Failure of the performance requirements could result in significant upgrades, which take time to implement. With the potential for significant upgrades to a majority of applicable Facilities, Duke Energy cannot agree with the Implementation Plan proposed.

Louisville Gas and Electric Company and Kentucky Utilities Company (LKE) supports providing Planning Coordinators (PCs) and Transmission Planners (TPs) 36 months until the effective date of the Standard to develop a procedure or technical rationale for selecting known outages of generation and Transmission Facilities, a process for establish coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis, and additional base case models and analysis. However, LKE believes that requiring "the planned System [to] continue to meet the performance requirements in Table 1 until 96 months after the effective date of Reliability Standard TPL-001-5" is too long. The three years before the effective date plus 8 years is 11 years. Other NERC standards do not have an 11 year time frame to fix an identified reliability risk to the BES.

KCP&L recommends extending to 60-months the preparation period prior to the effective date of the Standard.

In the alternative, provide flexibility or a process to extend the 36-month period based on the TP and PC's evaluation to implement the revised TPL-001-5 Standard.

Concern

The proposed Implementation Plan's time periods do not fully consider the differences in system sizes, complexity, and design elements.

Additionally, with the Standard's assessment scope expansion, the periods offered in the Plan need to consider barriers entities face staffing or contracting for the qualified personal to complete studies and implement CAPs.

KCP&L identified activities it anticipates will be required under the Standard that make the Plan's time periods insufficient to complete implementation of the proposed Standard. Here is an example:

- Changing and updating contingency lists will extend beyond the 36-month period because of the complexity and size of the undertaking and required vetting.

Beyond a single implementation activity, the implementation of the revised Standard will require long-duration, contingent, inter-related activities that, taken individually may fall within the 36-month period but, to collectively complete all the activities, will extend beyond the 36-month period. For example:

1. The best-case scenario to update and test dynamics software will take at least 12-months. The estimated period is without consideration of challenges to:

- Schedule the software upgrade and testing;
- Incorporate the additional P8 events and the re-alignment of Extreme events into the software; and
- Address the many "small" changes that will affect the planning models and assessments.

The proposed revision's specific and required assessments are contingent on updating and testing dynamics software. The period to complete the upgrade and assessments we easily see extending beyond the 36-month proposed implementation period.

A 36-month period to complete required assessments seems arbitrary when placed against the wide spectrum of applicable systems. In consideration of system differences, we recommend the 60-month period or, in the alternative, a process to extend the period based on TP and PC's evaluation to implement the revised TPL-001-5 Standard.

Texas RE appreciates the SDT's efforts in putting together the proposed Implementation Plan. Texas RE notes that, in its experience, registered entities have had significant issues understanding and following implementation plans. Texas RE therefore strongly encourages the SDT to carefully review the proposed Implementation Plan to ensure that is not ambiguous, vague, or confusing to understand.

To that end, Texas RE notes two aspects of the proposed implementation plan that could lead to potentially significant industry confusion. First, Texas RE notes that in establishing the requirement to complete planning assessments 36 months following the effective date of the standard approval, the proposed Implementation Plan is silent regarding the specific Standard Requirements that are actually implicated. Texas RE recommends that the SDT not merely rely on references to "planning assessments," but actually insert specific references to the Requirements subject to the 36-month planning assessment compliance threshold to reduce any possible ambiguity. Second, the proposed implementation plan provides that the requirement to implement Corrective Action Plans (CAPs) to be "the first calendar quarter 84 months following applicable regulatory approval of TPL-001-4." The effective date of the FERC Order approving TPL-001-4 is December 22, 2013. As such, the CAP requirement would, on its face, be due on March 1, 2020. Because TPL-001-5 will not become effective for at least 36 months following any applicable regulatory approvals, this requirement would trigger *prior* to the effective date of the proposed TPL-001-5 Standard. This appears to be in error, and Texas RE suggests that the SDT revise this aspect of the implementation plan accordingly – perhaps by inserting a reference to TPL-001-5 instead of TPL-001-4.

In addition to these issues, Texas RE presently understands the implementation plan, as currently drafted, to provide the following glide path to full implementation of the proposed TPL-001-5 Standard:

First calendar quarter 36 months following regulatory approval.

· The effective date of the standard is the first day of the first calendar quarter 36 months following the effective date of the applicable governmental authorities order approving the standard. This date serves as a starting point for the implementation plan.

· In accordance with the Initial Performance section, applicable entities must complete the planning assessment without CAPs by the effective date of the standard, or 36 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes there is no requirement mentioned. In the interest of clarity and not being vague Texas RE strongly recommends the implementation plan specify which requirement this date refers to.

60 months following regulatory approval.

· In accordance with the Initial Performance section, applicable entities must develop any required CAPs under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13, items b, c, and d, and P8 by 24 months following the effective date of the standard, or 36 months plus 24 months, or 60 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes this is also indicated in the Compliance Date section.

For 84 months following regulatory approval

o Texas RE noted the issue with the standard version above in reference to the Note Regarding CAPs. Assuming this should indeed specify TPL-001-5, rather than TPL-001-4, CAPs applying to the specified categories of Contingencies and events identified in TPL-001-5, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Form Transmission Service.

132 months following regulatory approval

o In accordance with the Compliance Date section, entities have 96 months from the effective date to end the use of CAPs developed to address failures to meet Table 1 performance requirements for P5 and P8 events only. The way this is written indicates entities have 36 months following the effective date of the applicable governmental authorities order approving the standard *plus 96 additional months* to end the use of CAPs. Is it the SDT's intent that this be *132 months from the effective date of the applicable governmental authority's order*? This timeline seems excessively long and would unnecessarily burden registered entities to prove it is doing anything to support the reliable operation of the grid based on an assessment.

In addition to the two confusing aspects noted previously, Texas RE noticed additional areas in which this implementation plan lacks clarity.

· First, the implementation plan uses different but similar terms: Effective Date, Compliance Date, and Initial Performance Date. While implementation plans in the past have used Effective Dates to indicate the starting point at which all activities are based upon, the use of the Effective Date is inconsistent in this plan. The implementation plan calculates when applicable entities must do planning assessments from the effective date (must be by the effective date for planning assessments without CAPs) as well as it calculates when any required CAPs under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13, items b, c, and d, and P8 must be developed (24 months following the effective date). It is *not* used to calculate the date by which applicable entities must end their use of CAPs, nor is it used to calculate the date by which CAPs should not include Non-Consequential Load Loss and/or curtailment of Firm Transmission Service (see Note Regarding CAPs). This date is calculated based upon the effective date of the applicable governmental authority's order. To improve clarity, the effective date should be used consistently.

· Texas RE inquires as to the difference between the terms Compliance Date and Initial Performance Date. The Compliance Date section contains the same information as the second paragraph of the Initial Performance section. Are they intended to mean two different things since two different terms are used?

· It is also unclear to which requirements the actions refer. Are we to assume that if the requirement is not mentioned specifically, it is enforceable on the effective date of the standard?

The 36-months period for the proposed standard to become effective seems to be adequate along with an additional 24-months period for the development of CAP for the newly identified issues only with new P5. However, we do not agree with the overall Implementation Plan. The P8 event proposal is out of scope based on our response for Q1. Therefore, We do not agree with the development of CAP for P8 either. There should not be a performance requirement for an extreme event and hence no CAP needs to be mandated. If the analysis for the extreme events with the clarified Footnote 13 with the single points of failure concludes there is Cascading, the PCs and TPs shall conduct an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences. This is already required today for compliance with the Requirement R2 sub-requirement 4.5 of TPL-001-4. Any development of CAP and its implementation plan for such an extreme event should be at the discretion of the individual entities. We agree with the performance requirements for the updated P5 event. However, we do not agree with the 96-months period to meet the performance requirements for the newly identified issues with the proposed P5 events. As the SDT has acknowledged, the only way to meet the performance requirements for P5 events with single points of failure in Protection System will mostly be a capital improvement project to be installed at the identified substation(s). Even though performing the studies/analyses and the development of CAPs are within PCs' and TPs' control, they do not have any control in implementing the CAPs. The amount of capital improvement budget available, the outage coordination amongst various parties (GO, GOP, TO, TOP, system operators and even RCs), project scheduling as well as the availability of manpower to actually implement the CAPs at the substations with a sudden influx of work outside the routine job are numerous facets of the project implementation beyond the control of PCs and TPs. The size of the utility and the number of CAPs to be implemented can create additional different challenges for different types of utilities such as co-ops, municipals, IOUs etc. in different regions/markets (ISO/RTO/vertically integrated etc.) Suggestion: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, We recommend NERC survey the industry (PCs, TPs and Facility owners) with another ***Request for Data Under Section 1600 of the NERC Rules of Procedure*** for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual ***ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP)***.

SCE expects that bullet D in the revised footnote 13 as currently written will bring over half of the existing SCE protection systems into scope for assessment of delayed clearing for P5 events. Without a completed assessment of the impact to reliability, SCE expects that some substations will require Corrective Action Plans to bring protection systems to full redundancy or system reliability within performance requirements. SCE proposes that the implementation plan keep the initial 36 months until Assessments must include the new models and studies but increase the time for developing Corrective Action Plans for P5 and P8 contingencies to an additional 60 months instead of 24. Similar to when TPL-001-4 first became effective, certain categories of contingencies were recognized as needing additional time for Transmission Planning entities to raise the bar on system performance. SCE proposes that the same latitude be applied to TPL-001-5's proposed higher standard of system performance.

The implementation plan requires Oncor to perform contingency analysis for P8 contingencies and develop a Corrective Action Plan for any issues resulting from a P8 contingency. Oncor does not agree with the requirements pertaining to P8 contingencies as outlined in the first comment above. If the P8 contingency is adopted, the implementation time needs to be longer due to the effort required to gather the required information and perform the first analysis.

On page 2 of the implementation plan, there is a statement in the third paragraph which may require some clarification. In "…failures to meet System performance requirements, identified during subsequent Planning Assessment(s), for single points of failure in Protection Systems may not be mitigated by an Operating Procedure during an interim period before a mitigating capital improvement is installed" does the phrase "may not be mitigated" imply that interim Operating Procedures will not be allowed, or is this an acknowledgement (and acceptance) that there may be instances in which an interim Operating Procedure may not be sufficient to meet the System performance requirements? We assume the second interpretation is what was intended, but it is recommended that this statement be clarified to eliminate the possibility of misinterpretation.

4. Do you agree with the proposed revisions to TPL-001-4?

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

Answer	No
Document Name	

Comment

ERCOT would recommend two further revisions.

First, ERCOT recommends deleting requirement 1.1.2.1. This requirement is circular because one cannot know whether the known outage would result in Non-Consequential Load Loss when it occurs at the same time as a P1 event without performing the study in the first instance. Because this would effectively require one to study each P1 event combined with each known outage anyway, it would be simpler to delete 1.1.2.1 altogether while preserving 1.1.2.2 in order to directly address the relevant directive in FERC Order 786.

ERCOT recommends the following specific revisions based on the foregoing concerns:

1. Delete ", at a minimum:" from section 1.1.2 and replace with the full text of proposed 1.1.2.2 ("does not exclude known outage(s) solely based upon the outage duration.").

2. Delete sections 1.1.2.1 and 1.1.2.2.

Second, ERCOT recommends deleting the proposed additional language in requirements 2.1.3 and 2.4.3. This new language would clarify that the P1 events to be studied are those that are "expected to produce more severe System impacts on [the responsible entity's] portion of the BES." However, this is already permitted under requirement 3.4. This new proposed language is unnecessary and should be deleted.

ERCOT recommends the following specific revisions based on the foregoing concerns:

1. Delete proposed additional language "expected to produce more severe System impacts on its portion of the BES," from section 2.1.3.

2. Delete proposed additional language "expected to produce more severe System impacts on its portion of the BES," from section 2.4.3.

Eric Shaw - Eric Shaw On Behalf of: Lee Maurer, Oncor Electric Delivery, 1; - Eric Shaw	
Answer	No
Document Name	
Comment	

Oncor believes that the definition of 'non-redundant components of protection system' per Table 1, item 13 is consistent with FERC order 754 (2012) as well as NERC's technical paper on 'Redundancy of Protection System Elements' (2008) – However, this definition coupled with category P5 and newly added category P8 expands much beyond FERC Order 754 for the following reason:

- FERC Order 754 data request limited the buses to be analyzed by the voltage level and number of circuits associated with the bus. These criteria clearly were targeted to pick the more critical stations from reliability and stability stand point.
- The enforceable definition of the non-redundant protection scheme without general guidelines on where to apply such definition, in essence expands the assessment to the entire system without consideration to the criticality of the elements. Generally speaking, it is more common to have non-redundant schemes at smaller stations (lower kV, fewer transmission circuits, remote locations, etc.), as they have minimum system impacts during faults, and tend to have only localized issues (or outages that are not an issue).

Oncor recommends the assessments per category P5 and P8 should be limited to defined critical stations similar to FERC 0rder 754.

The redundancy as per Table 1-13(a) through Table 1-13(c) are reasonable replacement of 'relay failure' as per TPL-001-4. However, Oncor is not in agreement with Table 1-13(d) for the following reason:

In Oncor's experience, failure of DC control circuitry is an unlikely event in general. Additionally, if the circuits were to fail, the result would be a breaker failure (stuck breaker) resulting in operations of breaker failure schemes – avoiding remote delayed clearing which is much longer than breaker failure delay. Oncor believes this requirement is not sufficient justification to require assessing DC control circuitry.

1. We believe Requirement 2, Part 2.1.3 and Part 2.4.3 should complement our previous recommendation for Requirement 1, Part 1.1.2 on basing significant planned outages according to registered entity-selected facility ratings. The required studies should allow registered entities flexibility on which planned outages are necessary for P1 event studies, particularly those outages that incorporate Facility expansion, construction, or rebuilds and other solutions documented in Corrective Actions Plans.
2. The reference to open circuit within Footnote 13c needs further clarification. The term "dc supply" is ambiguous and needs to confirm the accepted configuration for substation control houses. Will this require two batteries, two separate battery chargers for a single battery bank, or

onsite backup generation as the accepted configuration? The technology currently available for detecting open circuits is problematic and can introduce addition points of failure when in service. We recommend clarifying the reference to read "A single station dc supply associated with protective functions required for Normal Clearing, and that single station dc supply is not monitored or not reported at a Control Center for abnormal DC voltages."

Richard Vine - California ISO - 2

Answer	No
Document Name	

Comment

The California ISO generally agrees with the proposed revisions to TPL-001-4, but would recommend two revisions.

First, the California ISO recommends deleting requirement 1.1.2.1. This requirement is circular because one cannot know whether the known outage would result in Non-Consequential Load Loss when it occurs at the same time as a P1 event without performing the study in the first instance. Because this would effectively require one to study each P1 event combined with each known outage anyway, it would be simpler to delete 1.1.2.1 altogether while preserving 1.1.2.2 in order to directly address the relevant directive in FERC Order 786.

The California ISO recommends the following specific revisions based on the foregoing concerns:

1. Delete ", at a minimum:" from section 1.1.2 and replace with the full text of proposed 1.1.2.2 ("does not exclude known outage(s) solely based upon the outage duration.").

2. Delete sections 1.1.2.1 and 1.1.2.2.

Second, the California ISO recommends deleting the proposed additional language in requirements 2.1.3 and 2.4.3. This new language would clarify that the P1 events to be studied are those that are "expected to produce more severe System impacts on [the responsible entity's] portion of the BES." However, this is already permitted under requirement 3.4. This new proposed language is unnecessary and should be deleted.

The California ISO recommends the following specific revisions based on the foregoing concerns:

1. Delete proposed additional language "expected to produce more severe System impacts on its portion of the BES," from section 2.1.3.

2. Delete proposed additional language "expected to produce more severe System impacts on its portion of the BES," from section 2.4.3.

Comment	
SCE's key disagreement with the proposed revisions is the language of bullet D of Footnote 13. SCE provided comments on bullet D during draft 1 regarding a monitoring provision like that contained in bullets B & C. The drafting team provided feedback as to its decision at that time due to limitations of PRC-005 monitoring. For draft 2, SCE responded to the direct feedback with additional substantive information for consideration regarding the role PRC-005 monitoring that allows extended maintenance intervals because the equipment will indicate if there is an issue. However, the drafting team didn't provide a rationale for the continued rejection of SCE's proposal to exclude control circuitry through the trip coils that are monitored and reported. Respectfully, SCE wishes to reiterate the reliability value in monitoring control circuitry combined with higher periodicity testing requirements for components such as electromechanical lockout relays required by PRC-005.

Aubrey Short - FirstEnergy - FirstEnergy Corporation - 4	
Answer	No
Document Name	
Comment	
• The NERC Drafting Team should consider limiting single points of failure at Generation Facilities and develop a criteria for applicability to GOs (Example: Limit GO applicability to relays associated to interconnection points and not all relays that are part of PRC-005). It is understood that this Standard does not directly apply to the GO under the Applicability section of this Standard but it appears they could ultimately be required to create Corrective Action Plans (CAPs) by the Transmission Planner or Planning Coordinator for non-redundant components of a Protection System. Also, singular generation units are already accounted for in Planning Assessments so single points of failure at these locations should be exempt from this analysis. Additionally, the SDT should consider only requiring GOs to identify single points of failure to be included in Planning Assessments but not require GOs to develop Corrective Action Plans (CAPs). The proposed revisions as written, when applied to GOs, would provide little reliability benefit but could potentially result in significant cost associated with upgrading Facilities. • Single protective relays and single control circuitry referenced in footnote 13 are prevalent for equipment at voltages 100kV -229kV and generally do not meet the redundancy requirements in the proposed revisions of this Standard. The SDT should consider making footnote 13 applicable to equipment at 230kV and above. • Single communication systems referenced in footnote 13 should be clarified by the SDT and state backup communication can use time delay functionality (does not use communication system) if relays can clear normally. The current wording implies that two independent communication paths are required to report issue back to the Control Center. Additionally, the SDT should consider allowing weekly communication checkbacks that report back to the Control Center as a method to meet the communication requirements in footnote 13. • A single dc supply referenced in footnote 13 would add significant cost with little benefit for dc supply open circuit monitoring in real-time. The SDT should consider addressing dc supply open circuit during quarterly battery maintenance in PRC-005-6 to reduce cost impact to industry. The estimated total cost for installing dc supply open circuit monitoring would be roughly $50,000 per location.

Comment

We disagree with the proposed revision to TPL-001-4. Particularly, the inclusion of the new planning event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 sub-requirement 4.5 for extreme events and Cascading (keep this section unchanged from the current TPL-001-4 standard).

The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate.

The inclusion of measures (M) for each Requirement is appropriate.

The clarifications added for the planned maintenance outages of significant facilities from future planning assessments are appropriate and seem to adequately addresses the Commission’s directive from Order No. 786 Paragraph 40.

The clarifications added for entity’s spare equipment strategy for the unavailability of long lead time items are appropriate and seem to adequately addresses the Commission’s directive from Order No. 786 Paragraph 89.

The replacement of the ‘Special Protection Systems’ with ‘Remedial Action Schemes’ is appropriate.

Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure in Protection System (for single phase faults) as well as the recommendations from the joint report from SPCS and SAMS.

The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13.

Suggestion: Restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This should adequately address the Commission’s concern (for three phase faults) from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

While there are many improvements implemented in this posting, there are still some modifications that should be made as articulated in the responses to the previous questions in this Comment Form, and additionally:

Requriement 2, Part 1.5, we suggest modifying the following phrase (see BOLD font for modifying word): "…….the impact of this possible unavailability on System performance shall be assessed. The **analysis** shall be performed for the P0, P1, and P2 categories identified in Table 1….." to"…….the impact of this possible unavailability on System performance shall be assessed. The **assessment** shall be based on analysis performed for the P0, P1, and P2 categories identified in Table 1…..".

Part 2.1.3 and 2.4.3 - We propose alternative text for Part 2.1.3 and 2.4.3, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with the **selected** outages modeled in Requirement R1, Part 1.1.2, under those System peak, Off-Peak, **or other** conditions when **the selected** outages are scheduled **or planned to occur**."

The System peak or Off-Peak models will normally be suitable for the Part 2.1.3 requirement. However, explicitly requiring the assessment obligation to be based on only these models excludes the option of using of other models that can represent the applicable system conditions more appropriately than the System peak or Off-Peak models.

The addition of the word, "planned", allows the inclusion of outages identified by PCs or TPs that are necessary in the planning horizon to implement Corrective Actions Plans – as most if not all are likely not to be scheduled yet.

Item h in the first page of Table 1 should be relocated to "after Item e" but before the Steady State section. Then re-alphabetize accordingly.

Footnote 14 - We propose adding a **Footnote 14** that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, "Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES. Subsequent, corresponding SLG fault contingencies may be performed, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss or Cascading. "

Even with the relaxation of required performance, the rationale to include 3 phase faults with the failure a non redundant component of a Protection System is too onerous (P8).

Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	No
Document Name	
Comment	

In addition to the issues noted in #2, Texas RE noticed the following:

- In Part 3.4, Texas RE is concerned that allowing registered entities to select which P1 events are “expected to produce more severe System impacts”, registered entities have the flexibility to ignore P1 events without determining the actual impact of the events. Texas RE recommends all P1 events should be selected.
- In Table 1, Texas RE noticed P8 is not listed in Steady State Only or Stability Only. Is it the SDT’s intent to leave it out of those conditions?

Comment

KCP&L recommends the Standard include language that will allow establishing the scope of contingencies in dynamics to a specific area local to the equipment.

Concern

The proposed revisions substantially expand required assessments and studies, including long-lead time equipment into dynamic analysis, and consideration of all outages—without limitation—during the assessment process.

The company recognizes the proposed revisions reflect the Orders’ language requiring consideration of outages without limitation, and so forth, but the language to satisfy the Orders require markedly greater resources.

Recommendation

KCP&L suggests adding language that provides an efficiency, or like efficiencies, in the assessment process and addresses the Standard Requirements. We suggest the following:

Requirement language or guidance that establishes the scope of contingencies in dynamics to a specific area local to the equipment. This provides an efficiency in the evaluation of contingencies by allowing the TP to draw a bus-ring around applicable equipment and evaluate contingencies within a smaller, yet relevant, range.

Michael Jones - National Grid USA - 1, Group Name National Grid

Answer	No
Document Name	

Comment	
National Grid would like to express our appreciation and supports the direction in which the TPL-001-5 SDT is proposing to adjust the NERC Reliability Standard TPL-001, including the creation of the proposed P8 event. We believe that, in particular, Footnote 13 still includes some ambiguity in defining what protection performance is needed to reduce the risk of reliability impact from Single Points of Failures, and would like to provide the following comments: Does "spare equipment strategy" mean the existence of at least a single spare for major transmission equipment that has a lead time of more than one year; and does Requirement 2.4.5 imply that the existence of such a spare would eliminate the need to assess the impact of the possible unavailability of such equipment on System performance? If so, then Requirement 2.4.5 should be written this way. As currently written, Requirement 2.4.5 lacks clarity. Every reasonable "spare equipment strategy" for equipment with a lead time of one year or more could result in the unavailability of such equipment; it is a matter of probability. For example, an Entity with 100 large power transformers could have a spare transformer strategy of maintaining one system spare. However, it is possible that two transformers could fail during time span of one year. With only one spare, the Entity would be exposed to operating the system for up to one year with one less transformer than designed. Even if the Entity has four (4) spares, it is still possible that five (5) transformers could fail during one year (albeit with much lower probability), which would leave the Entity similarly exposed. Greater clarity is required for Requirement 2.4.5, as is more criterion development. It is not fully clear as to what constitutes "comparable" in the context of comparable Normal Clearing times in Table 1 Footnote 13 Part a. Please also clarify what constitutes an "alternative" relay, beyond allowing for response to non-electrical quantities. What if alternative relay does not provide the same clearing time as the primary relay (e.g., the alternate relay is an impedance relay with longer Zone 2 timer, or the alternative relay is an overcurrent relay, while the primary relay is an impedance relay). Could any relay classified as an "alternative" relay be considered as 'redundant', and therefore Footnote 13 would not apply? We would like the SDT to provide guidance on what constitutes "comparable" Normal Clearing times and an "alternative" relay, e.g., in a 'Guidelines and Technical Basis' section. Even after including auxiliary relays and lockout relays, it is still not fully clear what the term "control circuitry" includes. As written, it seems that "control circuitry" (apart from wiring) includes auxiliary relays and lockout relays. Since we believe it could be advantageous to provide a more 'formal' definition of this term, we suggest providing additional guidance in a 'Guidelines and Technical Basis' section and/or including a definition for "control circuitry" in the 'Glossary of Terms Used in NERC Reliability Standards'. As another Entity brought up during the NERC webinar on March 22, 2018, why does the exclusion (provided per Footnote 13 Part b) for communication systems not also extend to single protective relays (referred to in Footnote 13 item a), if monitored or reported at a Control Center? We also believe it would be of value to consider requesting entities to document the rationale regarding considerations regarding non-redundant components of a Protection System evaluated per Footnote 13.

Comment	

It is recommended to consider revising Sections 3.2 and 3.5 in a similar manner to the proposed revisions to Sections 4.2 and 4.5.

Additional Comment for consideration, related to Requirement #4 (related to clarification of the Standard):

Requirement 4.1 states that "Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1….." Immediately after 4.1, sub-requirements 4.1.1 through 4.1.3 specify specific system/generator stability performance requirements which are not mentioned in Table 1. Our observation is that Table 1 includes steady state and stability related performance requirements. This apparent placement of performance requirements in more than one location within the Standard document is confusing. Recommendation for consideration is to move sub-requirements 4.1.1 through 4.1.3 to Table 1.

Additional Comment for consideration, related to clarification of the Standard:

Regarding Table 1, if the performance requirements (steady state / stability) are not being met, AND, if Table 1 indicates that non-consequential load loss and interruption of Firm Transmission Service are allowed, is a specific corrective action plan required as per Requirement 2.7 (assuming that non-consequential load loss and/or interruption of Firm Transmission Service would allow for meeting the performance requirements)? This question relates to a scenario where Footnote 12 does not apply. A general recommendation is to clarify within the standard whether or not a specific corrective action plan is required to be documented, as per Requirement 2.7, in the Planning Assessment for this scenario (i.e. performance requirements are not being met and Footnote 12 does not apply).

Comment

GRE agrees with the MRO NSRF and ACES comments and:

13b. Single communications system

- Monitoring a single communication scheme does not provide the same robustness as having a redundant communication scheme.
- Communication failures in blocking schemes do not result in delayed clearing.
-
- It is important for planning to identify locations where delayed clearing of faults (such as in zone 2 time) could lead to cascading outages or stability concerns. If faster clearing times are required, these elements should have redundant communications installed. In many companies, these studies are already being performed. If not, the requirement to study the impact of failures of single communication schemes could drive a company to identify where redundant communications are required.
-

- The intent of the standard is to study failures/contingencies which are most impactful to the BES. Typically, single communication schemes are in place to limit damage, improve coordination and as a good design practice. If a communication scheme is installed for these reasons, the "Normal clearing time" of the protective system may not be necessary to maintain system stability or prevent cascading outages.
-
- The use of the phrase "Normal Clearing time" should be changed to "time required to maintain system stability" or "critical clearing time" or "time to prevent misoperation, cascading, or unintentional islanding". Otherwise, non-redundant communications systems which were not installed for the purpose of maintaining stability would need to be evaluated (or monitored). Such evaluation would be an unnecessary burden.

13c. Single station dc supply

- How common is the monitoring of a battery open circuit condition? FERC Order 754 report says it was not common at the time of the order to have redundant batteries, and it is probably not that common now to have redundant batteries or open circuit monitoring. Without open circuit monitoring, it is possible that a charger might mask an open circuit in the battery. Open circuit monitoring is possible but is not universally applied where there are single batteries.

- FERC Order 754 only applied to 200 kV substations or higher. The number of substations lower than 200 kV without redundant batteries will be substantially higher.

- GRE's standard design for new 230 kV substations or higher is to install redundant batteries, but we have many existing facilities that have one battery bank with redundant AC supply. Monitoring for open DC supply has not been considered in the past when defining a redundant DC supply.

- Periodic open circuit testing as required by PRC-005 will likely not meet the requirement of open circuit monitoring.

- This requirement seems likely to drive industry to either retrofit existing installations with open circuit monitoring or to install redundant DC supplies. Is this the appropriate place to drive that decision, for a high impact/low risk battery failure? This could be a significant impact, and it appears that this impact may not be fully understood in the context of reviewing this standard.

- Should a risk based approach be considered—an open circuit battery failure is a low risk, high impact event?

13d. Single control circuitry

- As written, this seems to apply to components (coils, auxiliary relays) and wires.

- Verifying where there is single control circuitry could be costly—there are many legacy installations which may not follow present design practices and would require some type of manual review of substation drawings.

- Consider audit evidence for this requirement. Documentation of present design standards which meet the requirement is practical, will it be sufficient?

- A risk based approach to this requirement which limits the review to redundancy of components instead of wires may be practical. The failure rate of wiring is far less than that of components.

Footnote 13, item c lacks clarity as to what constitutes a single station d.c. supply. Typical stations are configured with two components that operate as a single d.c. supply system – an inverter and battery bank. Each of these components provide some redundancy to provide d.c. load for failure of the other component, which could be interpreted as meeting the requirements for a redundant system with no further monitoring required per Proposed Reliability Standard TPL-001-5 Table 1. However, if the entire d.c. supply system is considered a single component, then the requirement to monitor for open circuit is not sufficiently clear to determine if the inverter, battery, or load must be monitored for open circuit. PPL NERC Registered Affiliates requests clarification to Proposed Reliability Standard TPL-001-5 Footnote 13, item c – specifically, as to what constitutes a single station d.c. supply to eliminate ambiguity of the requirement to monitor for open circuit needs.

Part 2.1.3 - We suggest adjustments to Part 2.1.3 that coordinate with our Question 2 comments, “P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned.”

We propose that the standard include wording that will allow the option of studying any known outages under the conditions that they are planned to occur when those conditions are more appropriate than System peak or Off-Peak conditions.

Part 2.4.3 - We propose adjustments to Part 2.4.3 that coordinate with our Question 2 comments, “P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned”.

Same explanatory text as Part 2.1.3.

Table 13, Footnote 13

For 13.b, the monitoring and reporting exception is not consistent with the 13.a requirements for protective relay redundancy, even though communication system components can be very similar in design and performance. The interval of monitoring and reporting is not defined. The ability to monitor the status of a communication system component does not fully mitigate the risk of the failure of a non-redundant component and should be treated like protection components identified in 13.a.

For 13.c, Wording should be added to clearly state that the combination of a dc charger and a dc battery is part of a single dc supply to avoid inconsistent interpretation of a single dc supply. The interval of monitoring and reporting is not defined. The PRC-005 standard requires that “Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.” Some battery open circuit monitors, that are presently available, have monitor intervals that only occur every few months, which are significantly longer than the PRC-005 maintenance requirement. The normally long open circuit monitoring intervals is expected to make the open circuit monitoring exception irrelevant.

For 13.d, the wording of “single control circuitry” is non-specific and may lead to inconsistent interpretation. The SDT should use a risk-based approach for identifying applicable circuitry that recognizes that wiring has a much lower risk of failure than the other Footnote 13 components. A risk-based approach would allow the industry to appropriately prioritize resources to meet the objectives of the standard and insure Bulk Electric System reliability.

Footnote 14 - We propose adding a Footnote 14 that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, “Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES, than the corresponding SLG fault contingency. Subsequent, corresponding SLG fault contingencies may be performed, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. “

Answer	No
Document Name	

Comment

In addition to the comments written above in answer to Questions 1 and 2, FMPA notes that the questions in this comment form do not cover all of the changes. Order 786 required more than just the changes to Requirement 1, part 1.1.2. There is also the addition of Requirement 2.4.5, adding stability analysis as required per an entity’s Spare Equipment Strategy. FMPA notes that while studying these events in steady state using P0, P1 and P2 events, doing so for stability doesn’t quite make sense. FMPA would support an alternative that simply stipulates that the PA/TP should study which ever Planning event it feels would be the most prudent based on the specific facility(ies) that could be out of service. Many entities do not run P1 events in stability – rather, they simulate other Planning events that, in their engineering judgment, produce more severe system impacts. Thus it doesn’t make sense to add P1 events just because a major facility could be out of service – this may not change the fact that another event such as a P4 or P5 may still be more important to study due to clearing times, and it doesn’t really save the entity any time.

Part 2.1.3 - We suggest adjustments to Part 2.1.3 that coordinate with our Question 2 comments, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned.

We propose that the standard include wording that will allow the option of studying any known outages under the conditions that they are planned to occur when those conditions are more appropriate than System peak or Off-Peak conditions.

Part 2.4.3 - We propose adjustments to Part 2.4.3 that coordinate with our Question 2 comments, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned.

Same explanatory text as Part 2.1.3.

Table 1, Footnote 13

For 13.b, the monitoring and reporting exception is not consistent with the 13.a requirements for protective relay redundancy, even though communication system components can be very similar in design and performance. The interval of monitoring and reporting is not defined. The ability to monitor the status of a communication system component does not fully mitigate the risk of the failure of a non-redundant component and should be treated like protection components identified in 13.a.

For 13.c, Wording should be added to clearly state that the combination of a dc charger and a dc battery is part of a single dc supply to avoid inconsistent interpretation of a single dc supply. The interval of monitoring and reporting is not defined. The PRC-005 standard requires checking dc batteries for the open circuit condition at least every 18 months. Some battery open circuit monitors, that are presently available, have monitor intervals that only occur every few months, which are significantly shorter than the PRC-005 maintenance requirement. The PRC-005 standard also requires the checking of dc battery voltage levels every 4 months. Finally, the PRC-005 standard requires that “Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.” Does the SDT think these timeframes are acceptable?

For 13.d, the wording of “single control circuitry” is non-specific and may lead to inconsistent interpretation. The SDT should use a risk-based approach for identifying applicable circuitry that recognizes that wiring has a much lower risk of failure than the other Footnote 13 components. A risk-based approach would allow the industry to appropriately prioritize resources to meet the objectives of the standard and insure Bulk Electric System reliability.

Footnote 14 - We propose adding a Footnote 14 that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, “Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES (P8), than the corresponding SLG fault contingency (P5). And only simulate a SLG fault of the corresponding contingency, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. “

NVE proposes the following changes for various requirements listed below:

Table 1, Footnote 13d

NVE recognizes the importance of studying the impact of a failure of a single control circuitry, but has concerns with the duplication of component types in this footnote with other planning events. Studying the failure of control circuitry associated with a breaker trip coil would result in a breaker failing to operate for a fault. This is the same effect as a fault plus a stuck breaker. NVE recommends that Footnote 13d be modified to include studying the failure of auxiliary relays and lockout relays. Footnote 10 should be modified to include scenarios of a failure of a single breaker trip coil to operate.

Table 1, Footnote 13c

Wording to this footnote should be changed to match the portion of the definition of Protection System associated with dc supply to ensure that the failure of any component of a dc supply is studied.

A single station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery based dc supply) required for Normal Clearing….

R4.2 and R4.5

NVE agrees with the proposed changes to R4.2 and R4.5. Given that the wording and intent of R3.2 and R3.5 is the same as R4.2 anD R4.5, but for different portions of the planning study (steady state vs dynamic), NVE recommends that R3.2 and R3.5 be modified to match R4.2 ans R4.5 to maintain consistency.

OG&E recommends that Table 1, Footnote 13(d) should be revised to allow exceptions for trip coil circuit monitoring as follows:

"d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing**, which is not monitored or not reported at a Control Center**.

OG&E suggests restoring the language contained in the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (but without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the Commission's directive from Order No. 754, and is consistent with the recommendations from the Joint Report regarding three phase faults.

Part 2.1.3 - We suggest adjustments to Part 2.1.3 that coordinate with our Question 2 comments, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned."

We propose that the standard include wording that will allow the option of studying any known outages under the conditions that they are planned to occur when those conditions are more appropriate than System peak or Off-Peak conditions.

Part 2.4.3 - We propose adjustments to Part 2.4.3 that coordinate with our Question 2 comments, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned".

Same explanatory text as Part 2.1.3.

Table 13, Footnote 13

For 13.b, the monitoring and reporting exception is not consistent with the 13.a requirements for protective relay redundancy, even though communication system components can be very similar in design and performance. The interval of monitoring and reporting is not defined.

For 13.c, Wording should be added to clearly state that the combination of a dc charger and a dc battery is part of a single dc supply to avoid inconsistent interpretation of a single dc supply. The interval of monitoring and reporting is not defined. The PRC-005 standard requires that "Alarms are reported within 24 hours of detection to a location where corrective action can be initiated." Some battery open circuit monitors, that are presently available, have monitor intervals that only occur every few months, which are significantly longer than the PRC-005 maintenance requirement.

For 13.d, the wording of "single control circuitry" is non-specific and may lead to inconsistent interpretation. The SDT should use a risk-based approach for identifying applicable circuitry that recognizes that wiring has a much lower risk of failure than the other Footnote 13 components. A risk-based approach would allow the industry to appropriately prioritize resources to meet the objectives of the standard and insure Bulk Electric System reliability.

Footnote 14 - We propose adding a Footnote 14 that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, "Transmission Planners (TPs) and Planning Coordinators contingency. Subsequent, corresponding SLG fault contingencies may be performed, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. "

Comment	

Santee Cooper disagrees with the proposed revisions to TPL-001-4. The inclusion of a new planning event that requires a CAP goes against Section 215 of the Federal Power Act which expressly prohibits NERC from promulgating standards which would require utilities to enlarge facilities or construct new transmission or generation.

Patricia Robertson - BC Hydro and Power Authority - 1,3,5, Group Name BC Hydro	
Answer	No
Document Name	
Comment	

BC Hydro appreciates the efforts of the SDT in revising TPL-001-5 – Transmission System Planning Performance Requirements. BC Hydro votes "No" and wishes to provide the following comment.

The proposed amendments scope from Single Point of Failure is very wide, which will apply to the entire bulk electric system i.e. 100 kV and above. Our ballot would have been affirmative if the scope were limited to extra high voltage (360 kV and above), where a single point of protection failure after a fault can trigger a major system disturbance.

Below extra high voltage levels, BC Hydro protection systems are built using principles of good utility protection practices, as described in the ANSI/IEEE standards and guides, to ensure that they have acceptable reliability i.e. clear faults without mis-operating. Our protection systems are largely redundant but still can have a single point of failure, such as where there is a shared breaker trip coil or a single telecom fibre etc. Based on our fifty years of operating experience, there is no known case where a single point of failure in our high voltage protection system precipitated in a major system disturbance event. It is because probability of a single failure (in our redundant high voltage protection system) impacting our system performance is negligible. Yet demonstrating compliance to the proposed amendments will require BC Hydro to redirect our critical resources (financial and people) in identifying single points of failure in our every single high voltage P&C asset, estimate incremental protection clearing time associated with that failure, and then demonstrate acceptable system performance during the event. Instead of redirecting our critical resources to demonstrate compliance to this negligible probability event, BC Hydro will receive higher reliability benefits by continuing to invest our resources in upgrading the aging protection systems.

Although appreciative of the drafting team's work on TPL-001-5, LES believes the following changes would provide greater clarity within the standard.

R2.1.3 & R2.4.3 – Recommend "when known outages are scheduled" be changed to "when known outages **occur**" to provide greater clarity.

R2.4.3 – The objective for including known outages in TPL-001-5 should be to ensure that all types of known outages are being reviewed while keeping the burden of additional stability analyses within reason. As currently drafted, the standard would require both steady state and stability analyses for all known outages included in the Planning Assessment. LES recommends modifying the standard to allow steady state analyses and limit stability analyses based on the use of Engineering Judgement in the Transmission Planner's technical rationale for selecting known outages. Recommend changing R2.4.3 to state "…under those System peak or Off-Peak conditions when known outages occur **and have been identified as requiring Stability analysis**".

Footnote 13a: To ensure "comparable" isn't mistaken to mean having identical Clearing times, LES suggests revising footnote 13a to instead state "…that provides comparable**, but not necessarily identical,** Normal Clearing times".

Footnote 13c: LES recommends removing "open circuit" from Footnote 13c. The absence of open circuit monitoring is too restrictive to consider a single station DC supply as non-redundant. Both a battery charger and battery provide DC supply redundancy because either device can provide DC power if the other device fails or has an open circuit. Additionally, PRC-005 provides adequate testing for open circuits.

In the response to Question 1, we voiced our concerns on the inclusion of P8. Rather than its inclusion, one possible alternative would be to redefine the definition of Delayed Fault Clearing to only include backup protection system with an intentional time delay. A separate term could be created for Breaker Failure Fault Clearing. Note that in the NERC technical paper "Protection System Reliability Redundancy of Protection System Elements" by the NERC System Protection and Control Subcommittee dated January 2009, page 13, the committee had to clarify the term for the purpose of their paper. Currently, this white paper is the primary source of guidance for this very complex topic. Due to the expansion of non-redundant components included in the proposed draft of the Standard, the terms provided in the NERC Glossary need to be further developed in order to provide clarity for their new application to this standard.

As stated in previous comment periods, we believe usage of the word "comparable" within footnote 13a is ambiguous. While we are not completely certain, we suspect the SDT means "less than or equal to" when using this word. If so, it would be preferable to instead state "A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides a clearing time less than or equal to Normal Clearing times;"

In both 13b and 13c, using the word "or" within "is not monitored or not reported at a Control Center" may not be consistently interpreted. Any possible confusion might be eliminated by instead using either "not monitored at a Control Center" or "is not monitored *and* not reported at a Control Center" in both 13b and 13c.

We feel that more explanation/guidance is needed to address what is and isn't included in the "components of a Protection System." The research to determine which of these components is a single point of failure, and what the delayed clearing time would be, is potentially quite expansive. We would like to have a more clear idea of the scope of this work and how the impacts differ from P4 and the existing P5 contingencies.

Comment	

CHPD disagrees with the proposed revision to TPL-001-4. Particularly, the inclusion of the new Planning Event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 sub-requirement 4.5 for Extreme Events and Cascading (keep this section unchanged from the current TPL-001-4 standard).

In moving the three-phase fault with protection system failure from an Extreme Event to a P8 Planning Event, the SDT has also changed the required performance levels from that of the Extreme Event to those of the planning standard, which creates an undue burden. Also, while the SDT stated in their Consideration of Comments to TPL-001-5 Draft 2 Question 1 "the SDT decided to make the three-phase fault followed by a protection failure a P8 event with no Cascading allowed or a Corrective Action Plan (CAP) requirement," the current language of the proposed standard doesn't clearly state that a CAP isn't required. CHPD disagrees with these changes.

The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate.

Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure in Protection System (for single phase faults) as well as the recommendations from the Joint Report from SPCS and SAMS.

The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13. However, CHPD would like to see non-redundant but monitored relays and control circuitry (as defined in Table 1 Footnote 13.a. and 13.d.) have the same exclusion as the monitored communication systems and station dc supplies as allowed in Table 1 Footnote 13.b. and 13.c. for Planning Events P5 and P8.

CHPD suggests the SDT restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This adequately addresses FERC's concern regarding three phase faults from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

PRPA supports JEA comments.

JEA disagrees with the proposed revision to TPL-001-4. Particularly, the inclusion of the new planning event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 subrequirement 4.5 for extreme events and Cascading (keep this section unchanged from the current TPL-001-4 standard).

The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate.

The inclusion of measures (M) for each Requirement is appropriate.

The clarifications added for the planned maintenance outages of significant facilities from future planning assessments are appropriate and seem to adequately addresses the Commission's directive from Order No. 786 Paragraph 40.

The clarifications added for entity's spare equipment strategy for the unavailability of long lead time items are appropriate and seem to adequately addresses the Commission's directive from Order No. 786 Paragraph 89.

The replacement of the 'Special Protection Systems' with 'Remedial Action Schemes' is appropriate.

Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure

Unofficial Comment Form Project 2015-10 and Single Points of Failure | February 2018 5
in Protection System (for single phase faults) as well as the recommendations from the joint report from SPCS and SAMS.

The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13.

Suggestion: Restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This should adequately address the Commission's concern (for three phase faults) from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

Sergio Banuelos - Tri-State G and T Association, Inc. - 1,3,5 - MRO,WECC

Answer	No
Document Name	

Comment

Tri-State does not agree with the language of Footnote 13:

Footnote 13 is weakly worded and suggests that elements of a protection system should be consider rather than shall be studied. Stronger language which clearly defines what components of a protection that are included and what are excluded should be used.

Section D: The standard does not adequately explain the difference between a breaker failing to operating and failure of an element of a protection system resulting in the breaker failing to operate. In most cases, the protection events and post-contingency system states are identical. An addendum or reference to technical documentation which clearly explains the scenarios where they may differ should be included.

The proposed change to requirement R1, part 1.1.2 to eliminate the six month minimum duration requirement for considering known outages introduces duplication of the studies currently performed in TOP-003 and IRO-017 Operational Planning Assessments. Removing the six month threshold also adds a considerable burden on the annual Planning Assessment without providing significant value by requiring studies be performed for short term maintenance outages in the Planning Horizon.

The annual TPL-001-4 Planning Assessments represent projected system conditions in the near-term and long-term planning horizons and are not meant to identify operational concerns for outages shorter than six months. The system models used in the Planning Assessment represent a general snapshot of stressed system conditions with all facilities in-service. Daily operational conditions almost never have the system entirely intact and available due to necessary system maintenance and testing. In addition, the information regarding planned outages occurring beyond year one of the near-term planning horizon would be expected to be limited or unavailable as most outages are scheduled within two months of the requested outage time. For these reasons, outages shorter than six months are more accurately addressed in the operations planning horizon, when more information is available regarding overlapping outages and current system conditions.

Planned outages are considered in Operational Planning Assessments. T**he IRO-017 standard establishes the outage coordination process** within the operations planning horizon, which covers the period from day-ahead to one year out. The outage coordination process includes development and communication of outage schedules, evaluating impacts and developing operating plans to mitigate outage conflicts, or rescheduling outages when necessary in order to reduce the reliability impact of the critical outage. This process ensures a more accurate modeling of expected system conditions, including information on concurrent outages.

Table 1, Footnote 13 – The ability to monitor the status of a Protection System Component does not fully mitigate the risk of the failure of a non-redundant component. The exception of 13b is not consistent with the requirements for redundancy in protective relays, even though the components can be very similar in design and performance.

For 13.b, consider removing the qualification, “which is not monitored or reported within 24 hours at a Control Center”. If the SDT believes the qualifications for monitoring and reporting are valid for the communication channel for a communications based relay scheme and elects to leave this, then ITC would only then suggest to add the same “which is not monitored or reported within 24 hours at a Control Center” qualification to 13.a . ITC, however, believes the better wording for the standard is to not have this gualification in either 13.a or 13.b.

We do however propose the following improvements :

- Requirement 2.5 addresses “material generation additions or changes”. These additions or changes should already have been included in the model as per (renumbered) R1.1.3. Thus 2.5 is superfluous. However if SDT retains this requirement, it should also address other material additions or changes such as load increase or relocation.
- Requirement 2.7.1: Examples should not be in a requirement, they should be moved to guidance.

- Replace « assessment » in requirements 3.3.1.1 and 4.3.1.2 with « Planning Assessment »

The following questions/requests were previously submitted; however, Tacoma Power is not clear about the drafting team's responses. 1. If monitoring of Protection System components is counted for purposes of TPL-001-5, is it the drafting team’s intent that an entity would be obligated to maintain the alarming paths and monitoring systems under PRC-005-6 (Requirement R1, Part 1.2, and Table 2)? An entity should be allowed to consider monitoring for purposes of TPL-001-5 but treat the associated Protection System component(s) as unmonitored for purposes of PRC-005-6. 2. Additional clarification is requested on the demarcation between station DC supply and control circuitry for purposes of TPL-001-5. It is recommended that the main breaker of DC panels be considered part of the station DC supply.

It is recommended that for P5 and P8 events in Table 1, the Drafting Team consider modifying the phrase “Fault plus non-redundant component of a Protection System failure to operate” to “Fault plus single component of a Protection System failure to operate” and modifying the phrase “Delayed Fault Clearing due to the failure of a non-redundant relay component of a Protection System protecting the Faulted element to operate as designed” to “Delayed Fault Clearing due to the failure of a single component of a Protection System protecting the Faulted element to operate as designed”. Similarly, note 13 in Table 1 might be modified to read “For purposes of this standard, failure of a single component of a Protection System is considered to be as follows”. It is suggested that this language might describe the same event a bit clearer, and in a way consistent with the description of similar failure for RAS as described in PRC-012-2. This would avoid any potential debate over the definition of redundancy - in order to determine what is a “non-redundant” component, one needs to define what does and does not constitute redundancy in this context (e.g., What about a backup relay that performs similar functions, but is not exactly the same? What about a duplicate relay with slightly different settings, or configured in the system in such a way that it responds a little slower? What if there is a “redundant” trip coil in a breaker, but it’s not hooked up?). It would also clarify that for the case of multiple non-redundant components in a particular Protection Scheme, that the simultaneous failure of all non-redundant components is required to be considered (we assume the intent in such a case would be to consider failure of each non-redundant component one at a time).

As provided in previous comments periods, Exelon recommends removing communication systems from footnote 13 in the revised standard. The SPCS concluded that the analysis of communications systems with regard to single points of failure did not pose enough of a risk for inclusion in footnote 13. As noted in the “Consideration of Comments”, the SDT “augmented the SAMS/SPCS recommendations to include the reference to the subset of communications systems that are part of a communication-aided Protection System”. By doing this, the inclusion of communications systems extends beyond the scope of the SAR to “[c]onsider the recommendations for modifying NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) as identified in the SPCS and SAMS report.”

Requirement R2.7 should be revised to reference Requirement R2, Parts 2.1.4 and 2.4.4 and not Requirement R2, Part 2.4.3 based upon the currently proposed draft. Requirement 2.4.4 is specific to the sensitivity studies.

The SDT should consider aligning the language in Requirements R3, Part 3.5 and R4, Part 4.2: “If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.”

Not only are some of the proposed changes from the SDT out-of-scope from the SAR and cost-prohibitive such as the addition of planning event P8, but the added reliability benefit is marginal for such a rare event compared to the cost, logistics, coordination and the aggressive implementation schedule that will be needed to achieve the desired outcome. Additionally, the implementation plan to achieve performance requirements for the modified P5 with single points of failure definitely needs an industry input. JEA is not disagreeing with the changes for P5 (please see our prior comments) but a more pragmatic approach is needed to address the industry concerns with CAP implementation to meet the Commission's directives especially in Order No. 754. **Suggestion**: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, JEA recommendations for NERC to survey the industry (PCs, TPs and Facility owners) with another **Request for Data Under Section 1600 of the NERC Rules of Procedure** for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual **ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP)**.

BPA feels that it is not cost effective to plan and construct a project for a planned outage of short duration that would be coordinated ahead of time according to outage planning processes (development of an operating plan) and would not be planned during peak seasons. It would also not be cost effective to plan and construct a project for a planned outage of short duration when planned outages of the same facility are not expected again in the foreseeable outage planning timeframes.

AZPS notes that it believes that, with the exception of Requirement 1, Part 1.1.2, the proposed TPL-001-4 is cost effective. As stated in response to Question 2 above, AZPS recommends that a definitive time period of “more than 3 months” be added to Requirement 1, Part 1.1.2. The inclusion of outages that are 3 months or less creates unnecessary study burden with little or no added reliability benefit and the currently proposed criteria increases the potential for inconsistency relative to planning assessments, which inconsistency increases costs while eroding the overall reliability benefit anticipated. Please refer to AZPS’s response to Question 2 for additional details.

Kristine Ward - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC

Answer	No
Document Name	
Comment	

Absolutely NOT. The SDT has not presented a solid cost effective analysis on the proposed changes leaving industry seriously questioning the process and the amount of work that would be potentially created by these changes and the minimal return on investment.

ADDITIONAL COMMENTS

1. In reviewing the edits to R1.1.2, I'm still concerned about the vagueness of those outages that must be modeled and whether such consultation will now require the RC to meet with each TP and PC separately within the FRCC on an annual basis.

2. Given the changes to requirement R1.1.2, we believe there needs to be applicability in the standard to the Reliability Coordinator and not just the PC and TP. Also, since the SDT struck out the duration of six months in R1.1.2, there should be a time-frame around the length of transmission outages given some outages are only for a few hours, some for a day, a week, a month, etc., that may not be covering the year, season, or load level entities are assessing.

(3) Regarding the edits to R1.1.2, what happens if the RC, TP, or PC disagree as to which outages to include in the System models? Is it acceptable to the SDT if procedures are written whereby not all entities are in agreement with which outages to include?

(4) In R2.1.5, the SDT changed "studied" to "assessed". Can the SDT provide background on what is now expected with the term "assessed" differently than what was performed under the term "studied"?

(5) In R2.4.5, can the SDT elaborate on what is expected in, and how detailed, an entity's spare equipment strategy should be that is needed for TPL-001-5?

(6) In R2.4.5, the wording "The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment" opens entities up to major compliance interpretation issues as it's not certain that entities will evaluate ALL conditions that the System is expected to experience in our Planning Assessment, this needs to be further clarified by the SDT.

(7) P5, and footnote 13, was modified to cover non-redundant components of a Protection System. This is a substantial additional burden onto entities. Seminole requests the team to perform a cost effectiveness study concerning these additional edits.

(8) In the Cost effectiveness Document updated(3/8/2018), pg 3 Footnote 13-(2 single-station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), How is this not a single point of failure?

PRPA supports JEA comments.

Not only are some of the proposed changes from the SDT out-of-scope from the SAR and cost-prohibitive such as the addition of planning event P8, but the added reliability benefit is marginal for such a rare event compared to the cost, logistics, coordination and the aggressive implementation schedule that will be needed to achieve the desired outcome. Additionally, the implementation plan to achieve performance requirements for the modified P5 with single points of failure definitely needs an industry input. JEA is not disagreeing with the changes for P5 (please see our prior comments) but a more pragmatic approach is needed to address the industry concerns with CAP implementation to meet the Commission's directives especially in Order No. 754.

Suggestion: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, JEA recommendations for NERC to survey the industry (PCs, TPs and Facility owners) with another Request for Data Under Section 1600 of the NERC Rules of Procedure for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP).

The proposed revision is potentially not cost effective depending on the clarification requested in question 4. We feel that more explanation/guidance is needed to address what is and isn't included in the "components of a Protection System." The research to determine which of these components is a single point of failure, and what the delayed clearing time would be, is potentially quite expansive. We would like to have a more clear idea of the scope of this work and how the impacts differ from P4 and the existing P5 contingencies.

Table 1, Footnote 13.d is not expected to be cost-effective as written. While the Standard Drafting Team chose wording to offer some flexibility for applicable entities to meet the requirements of Footnote 13.d, the vagueness of the current language is expected to lead to differences in interpretations between applicable entities and regulators. To avoid the risk of being judged non-compliant, applicable entities will need to assume a very liberal interpretation of Footnote 13.d and engage in an immense scope of work, which may find little or no adverse BES reliability impacts. The investigation of existing control wiring and development of applicable contingency descriptions are expected impose a very large demand on labor resources. We propose that the SDT defer imposing a “non-redundant control circuitry” requirement on the industry until the scope of work can be limited to cost-effective level through risk-based inclusion/exclusion criteria and more clear definition of applicable control circuitry.

If the Standard Drafting Team (SDT) does not add the proposed Footnote 14 in Table 1 (which makes it clear that TPs and PCs can perform the 3-phase fault simulations in a way that avoids unnecessary and duplicative SLG fault simulations), then the proposed standard may lead entities and

regulators to interpret that a significant amount of unnecessary and duplicative P5 event analysis is required for compliance. The unnecessary and duplicative P5 event analysis would not be cost-effective.

Proposed TPL-001-4 is not the most cost-effective way of meeting the FERC directives because the standard will compel the PC and TP to expend additional costs and staff resources to prepare and implement a CAP for P8 events, which is not required by Order No. 754. Because P8 events are	

considered to be rare occurences in the industry, requiring a CAP is not a effective use of resources. The following conclusion statement in the Joint Report on Order 754 supports this position: “This concern (the study of protection system single points of failure) is appropriately addressed as an extreme event in TPL-001-4 Part 4.5.” *See Order 754 Assessment at p. 11.*

MEC supports NSRF comments. In addition, the zero defect compliance work to maintain perfect protection system drawings and change management is significant with little additional actual system reliability gain due to the rare probability of a delayed cleared fault combined with a single-point-of-failure protection component failure that isn't already known. NERC and industry should work together to seek a better risk based strategy to focus on important substations. Examples could be the use of voltage class levels similar to FAC-003 (200kV and above or as identified by the RC / PA), high fault current levels similar to PRC-002, or number of transmission interconnections similar to the FERC Order 754 effort.

1. The required analysis of all scheduled outages in the near term horizon is not cost-effective, as it will result in many studies being run without meaningful results and/or with time spent "proving the negative".

2. Introducing a new type of event in Planning Event P8 creates unnecessary compliance burden and is illogical. Furthermore, it opens up industry to additional illogical changes to a planning standard that was generally working pretty well before these changes.

3. Flatly requiring P1/P2 events be studied in stability is likely to simply create busy work since an entity may (not a guarantee – based on details specific to each facility and engineering judgment) determine that a P4 or P5 is more appropriate to simulate, but would be required to run the P1 or P2 event regardless (e.g. in addition to those events the entity feels are best to study).

To determine if something is cost-effective, the analysis must consider alternatives to achieve a measurable outcome.

The FERC directives are narrowly drafted without significant alternatives to fulfill their outcomes. Reflected in the proposed revisions and Implementation Plan are the directives' narrow framework and, as such, a meaningful analysis of the revisions and Plan's cost-effectiveness is indeterminable.

The proposed revisions to this Standard would add significant resource and financial burden to TOs and GOs. Recommend for the SDT to evaluate System performance issues thru planning studies prior to making Corrective Action Plans (CAPs) mandatory in the Implementation Plan. This would provide time for the SDT to evaluate the impact and cost implications that these new Requirements have on industry. After an evaluation is done, then the SDT can determine what CAPs would be required and reduce the financial impacts to industry by utilizing a separate Implementation Plan.

1. We believe a more cost effective way approach to meeting the FERC directives exists. The proposed changes should allow registered entities the flexibility to determine how they will address this BES reliability risk. The currently proposed solution requires a registered entity to conduct a duplicative contingency analysis for a three-phase fault that is less likely to occur than a single-phase-to-ground fault under similar conditions.	

2. The “dc supply” reference to open circuit within Footnote 13c could require an entity to purchase additional equipment based on the accepted configuration. We recommend revising the footnote to only consider when the dc supply is not monitoring or reporting abnormal DC voltages.
3. We thank you for this opportunity to comment.

There is some correlation between FERC directives in Order NO. 786 and Order No. 754 such as a Tranmission Planner assessing their portion of the Bulk Electric System (BES) for locations at which a three [illegible] accompanied by a protection system failure could result in a potential reliability risk (Order No. 754) and the expansion on Protection System Failures versus Relay Failures (Order No. 786). However, EEI summarized it best by stating in Order No. 786 (p. 46), "...expanding planning studies to include all manner of protection system failures could create a scenario where planners would have to conduct unlimited and unbound studies."

The potential for unlimited studies to include all manner of protection system failures is not a cost effective way of meeting both FERC directives. This new revision expands the purview from relay failure to failure of all protection system components. Additionally, this requirement (and its predecessor) required assessments of entire system unlike the limited ones per FERC order 754.

OUC would recommend providing some guidelines in order to guide the discussion on how to solve issues found under new Planning Event 8, such as recommending Zone 2 or Zone 3 protection where applicable (if acceptable though testing) or the addition of dual and separate DC sources. Guidelines on what actions to take and when to take them (along with cooridinating these upgrades with the company's protection group) would help further keep the revisions cost-effective by providing a methodology of least cost options to higher cost options.

Comments received from APPA

Questions

1. Do you agree with the creation of the proposed P8 event?

☐ Yes
x☐ No

Comments: APPA concurs with the JEA comments that the addition of the P8 event is beyond what was in the Standards Authorization Request (SAR).

2. Do you agree with the changes to TPL-001-4 Requirement 1, Part 1.1.2, in order to meet the FERC directive in Order No. 786?

y☐ Yes
☐ No

Comments:

3. Do you agree with the proposed implementation plan?

☐ Yes
x☐ No

Comments: APPA believes the 36 month period for the proposed standard to be effective is appropriate as is the 24 month period for development of the CAP. However, we do endorse the overall implementation plan and support the reasoning for that lack of support provided in JEA's comments. Similarly, we support the JEA suggestion to remove the proposed P8 event and its associated CAP and seek industry feedback on a more feasible implementation plan.

4. Do you agree with the proposed revisions to TPL-001-4?

☐ Yes
x☐ No

Comments: APPA believes that the proposed revisions to TPL-001-4, especially the inclusion of P8 is not workable and supports the JEA comments and suggestions.

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754?

   ☐ Yes
   x☐ No

   Comments: APPA believes the proposed revisions and implementation plan will not result in a cost effective way to meet the FERC directives in Order No. 786 and Order No. 754. The inclusion of event P8 is the driver for increasing the costs of the proposed standard. Importantly, the increased costs are not commensurate with a material improvement in reliability.

   Public power endorses the JEA comments and suggestions.

General Summary

The SDT appreciates the comments submitted. Overwhelmingly, the industry response to the proposed Table 1 P8 Event was negative. The SDT considered the weight of the industry responses rejecting the proposed addition to the Planning Events and has removed it from the draft TPL-001-5 Reliability Standard.

The SDT believes it is important to reiterate that the industry has been aware of concerns about Protection System component single point-of-failure (SPF) and corresponding risks to the BES since as early as the 30 March 2009 NERC Alert. Further, it was clear from the SPCS and SAMS report, following the data collection and assessment in support of FERC Order No. 754, that SPF reliability concerns were substantiated. The draft TPL-001-5 language proposed by the SDT was consistent with how other identified risks to reliability are incorporated into the Transmission System Planning standard, including similar assessments of low probability events (e.g., breaker failure).

A SPF in a Protection System is a wholly-preventable risk to the BES. Likewise, existing Protection System designs, as well as future ones can be made to assure that SPF is not a concern. Faults, conversely, are and will remain an inherent risk to the Transmission System. The SDT believes that single line-to-ground (SLG) fault migration into a three-phase (3ph) fault is a very real phenomenon, especially considering the Delayed Clearing of the initiating fault that may arise due to a SPF in a Protection System. In other words, today it is not only probable but certain that portions of the BES protected by Protection System with SPF will experience, when a SLG fault initiates, the evolution of a SLG-to-3ph fault, given significant durations before backup protection initiates.

The locations of SPF can be identified, simulated under faulted conditions, assessed for impacts to System performance, and solutions identified; each of which the planning entities can play a meaningful role in achieving. The SDT evaluated numerous alternatives and ultimately proposed to industry multiple options for TPL-001-5 to elevate the Contingency event that represents a 3ph fault plus a failure of a non-redundant component of a Protection System:

1. Maintain 3ph fault + SPF in Protection System event in Table 1 Stability Performance Extreme Events, but require Corrective Action Plan (CAP) when Cascading identified.
   [TPL-001-5 Draft #1, Industry Comment period: 04/25/17 - 05/24/17]

2. Maintain 3ph fault + SPF in Protection System event in Table 1 Stability Performance Extreme Events; do not require a CAP, but do require stricter actions than typical Extreme Events when Cascading identified.
   [TPL-001-5 Draft #2, Industry Comment period: 09/08/17 - 10/23/17]

3. Move 3ph fault + SPF in Protection System event to Table 1 Steady State & Stability Performance Planning Events as P8 Event; require a CAP, but maintain the System performance requirement as Cascading.
   [TPL-001-5 Draft #3, Industry Comment period: 02/23/18 - 04/23/18]

Each of these options were rejected by industry, despite the SDT attempts to convey the reliability concept that SPF in a Protection System is preventable and to emphasize that the severity of an event's impact must temper the tendency to diminish its importance because it is perceived to be unlikely. The SDT has, therefore, made no change to the existing evaluation of 3ph fault in the Table 1 Stability Performance Extreme Events, except to separate breaker failure from the SPF in Protection System event.

1. ***Do you agree with the creation of the proposed P8 event?***	
Joe McClung - JEA - 3,5 - FRCC, Group Name JEA Voters	
Answer	No
Document Name	
Comment	

JEA appreciates the effort of the SDT to address the directives from the Commission on Order No. 786 as well as the recommendation in response to Order No. 754 from the SPCS and the SAMS from the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request which hereafter is called "Joint Report").

However, the proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report listed as one alternative the elevation of the P8 type events 'to a planning event with its own system performance criteria' (Joint Report, **Chapter 2 – Alternatives**, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that "**Probability of three-phase fault with a protection system failure is low enough that it does not warrant a planning event**". The creation of the proposed P8 event in this version has clearly overlooked this fact.

The Joint Report does agree that there is "the existence of a reliability risk associated with the single points of failure in protection system that warrants further action" (JEA agrees with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, **Chapter 3 – Conclusion**, pg 11). Accordingly, the SAR has defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which would include the P8 event. Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5. **Suggestion**: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Answer	No
Document Name	
Comment	

NextEra does not support P8 events being considered as planning events instead of extreme events. A 3PH fault plus protection system failure is a very low probability event.Ne

For the HV BES level, both Categories P5 and the new P8 events require the same performance for both a SLG fault and a 3-Phase fault. BPA believes the performance for the existing P5 is more conservative and the P8 Category is not required for the HV BES level. In addition, BPA suggests deleting the new P8 and modifying P5 to include a row for 3Ø (three phase) for the EHV BES level only allowing interruption of firm transmission service and non-consequential load loss.

Comment	

Adding P8 changes a an EXTREME contingency to a CREDABLE contingency. A 3 phase fault with delayed clearing was an extreme event under category D on Table 1 of the original TPL standards. This contingency has always been an extreme contingency. The question not being addressed is, "what reliability improvement can be accomplished by adding P8?". If P8 studies show instability, there is no requirement for a corrective action plan. Keeping in mind that this is a required standard, why create a P8 contingency, which will increase the work load and cause additional distractions, when the results don't matter?

Comment	
Seminole is in agreement with the comments submitted by JEA but would like to provide additional comments relating to the proposed P8 Event. In reviewing the Cost Effectiveness document, the Technical Rationale, the SPCS/SAMS Order 754 Report, and the proposed redline to the existing TPL-001 Reliability Standard, Seminole does not believe that the proposed P8 Planning Event is prudent and the technical rationale is flawed in light of what the SPCS/SAMS documented in their review of the Order 754 Data Request analysis. As documented by JEA, the SPCS/SAMS never recommended making a three-phase fault with a single point of failure a Planning Event unless it included its own performance criteria. Additionally, the SDT and the SPCS/SAMS clearly recognize that a three-phase fault is in and of itself an event that has a low probability of occurrence, and adding a low probabilistic single point of failure of a protection system on top and requiring that this be analyzed as a Planning Event is beyond prudent planning and results in diminishing returns from an analysis and cost effectiveness standpoint. The SDT also made a gross assumption in regards to the amount of work required to evaluate these events by stating that the P8 Planning Event does not require steady state evaluation and "ONLY" requires stability analysis as to insinuate that the level of work is somehow lessened by making this statement.	

The cost effectiveness document falls short of providing any substantive cost effectiveness in regards to the additional analysis that would be required by the addition of Planning Event P8 Suggestion: The existing Extreme Event within Table 1, 2f., allows for the Transmission Planner to use operating experience to develop a contingency event that would result in a wide-area disturbance, such a disturbance that one could presume would cause Cascading, voltage instability or uncontrolled islanding. Operating experience would bring one to the conclusion that the proposed P8 Planning Event is in fact a low probabilistic event and should NOT be considered a Planning Event but rather an Extreme event that is already part of the Extreme Event Table within Table 1

PRPA supports JEA comments. JEA appreciates the effort of the SDT to address the directives from the Commission on Order No. 786 as well as the recommendation in response to Order No. 754 from the SPCS and the SAMS from the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request which hereafter is called "Joint Report"). However, the proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report	

listed as one alternative the elevation of the P8 type events 'to a planning event with its own system performance criteria' (Joint Report, Chapter 2 – Alternatives, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that "Probability of three-phase fault with a protection system failure is low enough that it does not warrant a planning event". The creation of the proposed P8 event in this version has clearly overlooked this fact.

The Joint Report does agree that there is "the existence of a reliability risk associated with the single points of failure in protection system that warrants further action" (JEA agrees with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, Chapter 3 – Conclusion, pg 11). Accordingly, the SAR has defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which would include the P8 event.

Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5.

Suggestion: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 subrequirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This subrequirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from

Unofficial Comment Form Project 2015-10 and Single Points of Failure | February 2018 3
draft 2) and the clarified Footnote 13 will adequately address the Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Response	
Thank you for your comments. The addition of the Table 1 P8 Planning Event has been removed from the proposed TPL-001-5.	
Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

AEP does not agree with the creation and inclusion of P8 for the following reasons:

1. We see nothing within the project's final SAR which would accommodate the addition of a completely new Performance Planning Event in Table 1. As a result, we believe its proposed inclusion goes beyond the scope of the SAR.

2. The creation of P8 introduces an inconsistent treatment of breaker failure. A 3-phase fault with the failure of a non-redundant component of a Protection System (footnote 13.d, such as the failure of single-control circuitry that would prevent tripping but initiate breaker failure) that results in a breaker failure operation is considered a Planning Event in P8. However, the same 3-Phase fault with a stuck breaker is included under Extreme events in the Stability column and results *in the exact same event*. If a 3-phase fault results in a breaker failure operation, what is the reliability benefit of differentiating the cause between a Protection System component failure or a stuck breaker? While AEP disagrees with many aspects of the recently-proposed revisions, the concerns expressed in this paragraph are the primary drivers behind our decision to vote negative during this comment/ballot period.

3. AEP is concerned that the inclusion of P8, coupled with its indistinct relationship to P5, will lead to inconsistent decision-making when using and applying Table 1. This was well illustrated during the March 22nd webinar by both the questions posed and the responses and insight provided by Chris Colson. A number of possible scenarios were provided by remote attendees seeking insight how the table should be correctly applied in those cases. At times, Mr. Colson expressed appreciation for the thought process, reasoning, and "logical analysis" used by those who were posing the questions and referencing Table 1. Our own impressive was different however, as we believe referencing the Table in such a "nonlinear" or "cyclical" way would actually lead to inconstant interpretation and application of the table. As a result, we believe it is possible (and perhaps even likely) that the table will not be consistently applied.

In our response to Question #4, AEP has provided possible alternatives to P8's inclusion for the drafting team to consider.

Santee Cooper supports JEA's comments on this standard. No, the addition of the P8 event in Table 1 goes beyond what is required by the SAR. The Joint Report cited that the probability of a three-phase fault with protection system failure is low enough that it does not warrant a planning event. The creation of the P8 event is not warranted and should be removed.

We agree with adding 3-phase fault contingency events with delayed clearing due to Footnote 13 non-redundant components for analysis to the TPL-001 standard. However, we propose that these events be added to the Stability 2.a-2.d contingencies in the Extreme Event section of Table 1, rather than a new P8 contingency category in the Planning Event section of Table 1. The level of risk (probability and impact) of these events on BES reliability, as well as the level of Corrective Action Plans that would be triggered by being categorized as	

Planning Event is unknown. But the reliability impacts the new contingencies can become known, if they are added to the extreme events section. These new contingencies could be reclassified as planning events in a future TPL-001 revision, if warranted by on the results of the extreme event analyses. If the proposed P8 event contingencies are not reclassified as extreme events, then we suggest the addition of wording (see Footnote 14 suggestion for Question 4). This wording will make it clear to applicable entities and regulators that Transmission Planners (TPs) and Planning Coordinators (PCs) can first perform the 3-phase fault simulations first for contingencies. Then, only simulate a SLG fault of the corresponding contingency, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. The 3-phase fault contingency (P8) is expected to produce more severe System impacts than the corresponding SLG fault contingency (P5). The proposed Footnote 14 will help applicable entities avoid performing a significant amount of unnecessary and duplicative work with the confidence that regulators will not interpret that the unnecessary and duplicative work must be performed.

NIPSCO agrees with JEA's comments.

JEA appreciates the effort of the SDT to address the directives from the Commission on Order No. 786 as well as the recommendation in response to Order No. 754 from the SPCS and the SAMS from the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request which hereafter is called "Joint Report").

However, the proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report listed as one alternative the elevation of the P8 type events 'to a planning event with its own system performance criteria' (Joint Report, ***Chapter 2 – Alternatives****, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that "****Probability of three-phase fault with a protection system failure is low enough that it does not warrant a planning event****". The creation of the proposed P8 event in this version has clearly overlooked this fact.*

The Joint Report does agree that there is "the existence of a reliability risk associated with the single points of failure in protection system that warrants further action" (JEA agrees with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, ***Chapter 3 – Conclusion****, pg 11). Accordingly, the SAR has defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which would include the P8 event.*

Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5. ***Suggestion**: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the* Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

OG&E considers the proposal to categorize the P8 event as a Planning Event as being in conflict with the SPCS (System Protection and Control Subcommittee) and the SAMS (System Analysis and Modeling Subcommittee) recommendations contained in its "Order No. 754: Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" white paper ("Joint Report"). The SPCS and SAMS advised that three-phase fault Single Point of Failure events should remain categorized as Extreme Events and that "[probability] of a three-phase fault with a protective system failure is low enough that it does not warrant a planning event." *See* Order 754 Assessment at pp. 9 and 11. Recommendation: Remove the P8 event from the proposed language. The occurrence of this type of event is rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 subrequirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This subrequirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Given the similarities between P5 and P8 events, NVE recommends that the proposed P8 events should replace the existing P5 events. It is expected that in most portions of the BES, there will be few, or no, SLG contingencies that would result in more severe impacts than the corresponding 3 phase fault contingencies with a failed non-redudant component of a Protection System. A Footnote 14 can be added to the Fault Type that allows the Transmission Planner or Planning Coordinator to change the fault type from 3 Phase to L-G based on the failure of the non-redundant component of a Protection System being studied (i.e. a SLG fault for a failure of a single phase electromechanical relay) or based on the impact to the system.

P5 events already covers the concern of failure of non-redundant protection systems with a single line to ground fault. The majority of multiple contingency events in TPL-001 only require analysis of a more frequent single line to ground fault. By including the P8 event, development of a corrective action plan may be required for a very low probability event (3-phase fault plus failure of a protection system). Ideally the drafting team should attempt to calculate probabilities and keep the single and multiple contingency categories within roughly a one in thirty year probability of occurring. All other less frequent events should be considered extreme and it should be up to the discretion of the Transmission Planner/Planning Coordinator whether investment is warranted. If 3-phase faults are assumed to have a 1 in 10 year frequency and protection failure a 1 in 10 year frequency then a 3 –phase fault with protection failure has a 1 in 100 year frequency. Single phase faults have a higher probability of 1 in 1 year to 1 in 3 year depending on the voltage level. Protection failure with a single phase fault is closer to 1 in 30 years.

By creating the new "P8" single-point-of-failure category of events and by requiring a Corrective Action Plan (CAP) when such P8 events cause cascading or uncontrolled islanding, the Standard Drafting Team has clearly gone beyond the recommendation in the Standard Authorization Request (SAR). The SAR only recommends that the TPL-001-4 standard be revised "so that extreme event assessments must include evaluation of the three-phase faults with the described component failures of a Protection system." It does not recommend or

require that these new P8 events, which are extreme events, be held to a higher standard than thaFlppst of the other extreme events with a new event category unto itself. It also does not recommend or require that such events be mitigated with a CAP, a requirement that is not applied to any of the other extreme events. These P8 events are extreme events and should be held to the same criteria that is applied to the other extreme events. SMUD supports the SAR recommendation to include single-point-of-failure events in its annual assessment of extreme events. SMUD does not, however, support the hard requirement to mitigate such events when studies indicate they may lead to cascading or uncontrolled islanding and prefers instead to leave the decision to mitigate such events to the Planning Coordinator and Transmission Planner just as such discretion exists for all other extreme events. However, by including the P8 event in Table 1, it inappropriately and erroneously subjects the category P8, extreme events, to Requirement 2.7 that requires a CAP when performance requirements are not met, effectively exceeding the concepts included in the SAR. The P8 events is an extreme event and needs to be held to the same requirements as applied to other extreme events.

Duke Energy disagrees with the creation of the proposed P8 as a Planning Event. The proposed addition of the P8 event goes beyond of what is required in the Standards Authorization Request (SAR). The joint report by the SPCS and SAMS subcommittees considered the events (similar to the proposed P8) to be 'elevated to a planning event with its own system performance criteria' (Chapter 2 –	

Alternatives of the Joint-report) as one of the alternatives, however, the joint report did NOT recommend this alternative citing the fact that "Probability of three-phase fault with a protection system failure is low enough that it does not warrant a planning event". The probability of this event occurring is low, and the change of "relay" to "components of a Protection System" with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h is a significant improvement to the proposed TPL-001-5. It addresses ALL the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint-report. The implementation of the proposed P8 event is NOT needed and should be removed. We believe that Requirement 4 sub-requirement 4.2 together with clarified P5 (Table 1), modified extreme events – stability 2e-2h (Table 1), and the clarified Footnote 13 will adequately address the Commission's concerns.

Neither the SAR, FERC Orders, or the SPCS/SAMS report appear to require or explicitly recommend the creation of a new planning event type in order to address single-point-of failure. Based on the data reported in NERC's analysis of the Order 754 Data Request, the conclusion can be drawn that the majority of scenarios which will need to be analyzed under the P8 event will consist of lower voltage facilities which are less likely to create an "adverse system impact" as compared to higher voltage facilities that are more likely to have fully redundant protection systems. Such events are already included under the existing category of "extreme events" – a more efficient way to address the risks of critical SPF scenarios (as well as other critical vulnerabilities that might exist) might be to direct the TP or PC to develop a more defined process to screen extreme events, identify those which pose the greatest risk, and to determine those that may be appropriate to study and possibly mitigate.

Comment	
FMPA disagrees for the following reasons.	

1. The revisions exceed the properly and dutifully developed scope of the SAR, and do so without any substantiated basis (e.g. there is no "new evidence" to suggest the scope of the SAR should have been exceeded). Creating a Planning level event was a specific option considered by the NERC System Protection and Control Subcommittee (SPCS) and System Analysis and Modeling subcommittee (SAMS) in their joint report, referenced in the Technical Rationale for this Project. The purpose of the SAMS/SPCS joint report was to evaluate the available data and make a recommendation as to the level of reliability risk that did, or did not, exist, and recommend paths forward to address those risks. Industry provided the data for the Section 1600 data request dutifully and faithfully entrusting SPCS and SAMS to carefully anyalze that data and make reasonable recommendations to industry, NERC and FERC based on the evidence. This is what SPCS and SAMS did. The joint report concluded a Planning level event was not warranted and made recommendations to ensure that Protection system failures with three phase faults were studied as extreme events.

2. Elevating an event to a Planning event when data does not suggest this is warranted creates complexity and confusion and puts other events at risk of the same fate and changes aspects of the planning standard that were working well and did not need to be changed. The joint report concluded there was a reliability risk. FMPA agrees with this. The joint report recommended modifying the extreme events and footnote 13 in the TPL-001-4 standard. Again, FMPA agrees with this approach – it makes sense given the data that industry provided in the Section 1600 data request. Effectively, a protection system failure with a three phase fault represents the same reliability risk as a breaker failure event with a three phase fault, which is already studied as an extreme event. This grouping was already contemplated in the prior revision of TPL-001-4; it was the over-simplification of the description of protection systems in the footnotes and lack of explicit statements in the extreme events list in Table 1 that created the reliability gap. The end result of creating a Planning level event for Protection System failures would be to send the message that the other three phase fault extreme events which are statistically equivalent to them should also be studied as planning events.

3. FMPA disagrees with the Technical Rationale on three points and therefore does not agree that introduction of this P8 event is justified or warranted:

A. The Technical Rationale for this Project makes the argument that the reason a Planning Event is warranted is the mere fact that the joint report exists – a report which concluded the exact opposite. This makes no sense, and serves to undermine all the work industry, SPCS, and SAMS did in investigating the reliability risks and determining a path forward to address those risks.

B. The Technical Rationale's assertion that elevating protection system failures to a Planning Event is not significant since CAPs are only required if there is a risk of Cascading or or widespread electric service disruption doesn't make sense, since industry has previously, and through much development and debate, established the clear line that Planning events are based on more rigorous performance criteria than this. Hence, an event that is only required to be remedied if it causes Cascading or widespread electric service disruption (but not other performance criteria violations) is not a Planning Event and doing so only creates confusion in the standard where previously there was clarity.

C. FMPA also feels it is poor justification to claim that the prior round of industry comments requested the creation of this Planning event. The prior industry comments were solely a reaction to the confusion that was introduced into the standard when the SDT attempted to exceed the scope of the SAR by creating a quasi-third performance category. The result of this was industry felt forced to pick sides. FMPA does not believe any entity in industry, not one single commenter, would have recommended a Planning event if the original draft that was posted for comment had followed the scope of the SAR and left these events as extreme events where they belong.

FMPA would support doing what was recommended by the SPCS/SAMS joint report and what was written in the SAR for this project, and does not support exceeding the scope of the SAR nor the recommendation of the joint report, which this current proposition does. It is of the utmost importance that we send a message to industry that, when a 1600 data request is prepared and industry is asked to carefully analyze an issue, we will make use of that analysis and value it, and that when we request that changes to standards be based on careful, logical analysis, and that careful, logical analysis is completed, we follow the recommendations of that analysis.

To be very clear: FMPA believes protection system failures should be studied, and FMPA already studies protection system failures in a rigorous fashion.It is quite likely that, should FMPA identify performance issues due to protection system failures in its studies, FMPA and/or its members would upgrade its/their protection systems to address the observed issues. That is, good engineering and planning practices will be followed. However, FMPA believes that any system upgrades or CAPs that are mandated by the standard language should be based on reliability risks; and not just because they are “inexpensive or “easy”.

We agree with adding 3-phase fault contingency events with delayed clearing due to Footnote 13 non-redundant components for analysis to the TPL-001 standard. However, we propose that these events be added to the Stability 2.a-2.d contingencies in the Extreme Event section of Table 1, rather than a new P8 contingency category in the Planning Event section of Table 1. The level of risk (probability and impact) of these events on BES reliability, as well as the level of Corrective Action Plans that would be triggered by being categorized as Planning Event is unknown. But the reliability impacts the new contingencies can become known, if they are added to the extreme events section. These new contingencies could be reclassified as planning events in a future TPL-001 revision, if warranted by on the results of the extreme event analyses.

If the proposed P8 event contingencies are not reclassified as extreme events, then we suggest the addition of wording (see Footnote 14 suggestion for Question 4). This wording will make it clear to applicable entities and regulators that Transmission Planners (TPs) and Planning Coordinators (PCs) can first perform the 3-phase fault simulations first for contingencies. Then, only simulate a SLG fault of the corresponding contingency, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. The 3-phase fault contingency (P8) is expected to produce more severe System impacts than the corresponding SLG fault contingency (P5). The proposed Footnote 14 will help applicable entities avoid performing a significant amount of unnecessary and duplicative work with the confidence that regulators will not interpret that the unnecessary and duplicative work must be performed.

Due to possible confusion with interpretation of the new P8 event, we do not fully agree with the implementation of the new event in the Standard.	

The distinction and required performance criteria for the P5 and P8 events should be clarified and specifically documented within the Standard. As presented, Table 1 (Steady State & Stability Performance Planning Events) is difficult to interpret. One method to clarify the table might be to separate out the P8 event within Table 1 (Steady State & Stability Performance Planning Events) and specifically document the steady state and stability performance requirements for P8. For example, it is not clear from the Standard if a Corrective Action Plan is only required if the P8 event results in Cascading. One additional observation for Table 1 (Steady State & Stability Performance Planning Events). Per Table 1, steady state and stability analysis is applicable for the P5 event and the P8 event. The implementation of the P5 event and the P8 event in steady state analysis will likely be identical for both of these events (since fault type usually is not considered). However, • for P5, Non-Consequential Load Loss is not allowed for EHV facilities. • For P8, Non-Consequential Load Loss is allowed for EHV facilities. This is a possible contradiction that should be reviewed and clarified.

The proposed addition of the P8 event in Table 1 is overreaching and beyond what is required in the Standards Authorization Request (SAR) which states that the primary goal is to implement the recommendations in the Joint Report. Although the Joint Report listed as	

one alternative the elevation of the P8 type events 'to a planning event with its own system performance criteria' (Joint Report, ***Chapter 2 – Alternatives***, pg 9), it did NOT recommend this alternative. The Joint Report cited the fact that "***Probability of three-phase fault with a protection system failure is low enough that it does not warrant a planning event***". The creation of the proposed P8 event in this version has clearly overlooked this fact. The Joint Report does agree that there is *"the existence of a reliability risk associated with the single points of failure in protection system that warrants further action"* (We agree with this conclusion). This is why it recommended that additional emphasis in planning studies is needed to assess three-phase faults involving protection system single points of failure (Joint Report, ***Chapter 3 – Conclusion***, pg 11). Accordingly, the SAR has defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event in Table 1 goes outside the scope mandated by the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which would include the P8 event. Except for the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5. **Suggestion: The creation of the proposed P8 event is NOT warranted and should be removed. This occurrence of this type of event is very rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.**

CenterPoint Energy Houston Electric, LLC ("CenterPoint Energy") does not agree with the creation of the proposed P8 event. A three-phase fault plus delayed fault clearing due to the failure of a non-redundant component of a Protection System in one event is a very rare occurrence in power system disturbances, beyond the scope of a planning event, and therefore should be considered an Extreme Event. As an alternative to the creation of a proposed P8 event, CenterPoint Energy recommends modifying the Extreme Event requirement, as proposed in the approved SAR, to expressly require evaluation of a three-phase fault and Protection System failure.

TVA supports JEA's comments. We believe a three-phase fault including protection system failure would have an extremely low probability of occurring. Requiring implementation of actions to prevent these extremely rare events would cause a large and unnecessary financial burden with little benefit to our system reliability.

We believe the proposed three-phase analysis is duplicative to Category P5 events that study single-phase-to-ground fault types. While three-phase faults can be more severe, the probability of such events are less likely to occur. This could set a precedence requiring PCs and TPs to include other less likely events in their future studies, or held accountable otherwise. We recommend removing this proposed event from the standard and provide registered entities an opportunity to individually address, on their own and not required through this standard, the concerns to BES reliability raised during the FERC Technical Conference, recommendations from various NERC Technical Subcommittees, and the efforts of this SDT.

The SPP Standards Review Group considers the proposal to cateogorize the P8 event as a Planning Event as going beyond the scope of the Federal Energy Regulatory Commission's (FERC) Order No. 754. The FERC order requires that NERC review how single points of failure on protection systems are studied and identify additional actions necessary to address the matter; however, Order 754 does not require a Corrective Action Plan (CAP) to be developed or implemented. *See* Order No. 754 at PP 19-20. By re-categorizing P8 events as a Planning Event, rather than an Extreme Event, the proposed standard would require the TP to prepare a Corrective Action Plan in accordance with Section 2.7 *et seq.* of TPL-001-4. Summarily, the proposed revision presents a requirement not specifically defined by FERC.

Moreover, the proposal to categorize P8 contigencies as Planning Events conflicts with the SPCS (System Protection and Control Subcommittee) and the SAMS (System Analysis and Modeling Subcommittee) recommendations contained in its Order No. 754 assessment (Joint Report). The SPCS and SAMS advised that P8 events should remain categorized as an Extreme Event and that "[probability] of a three-phase fault with a protective system failure is low enough that it does not warrant a planning event." *See* Joint Report at 9 and 11.

Recommendations:

1. Remove the P8 event from the proposed language. The occurrence of this type of event is rare in power system disturbances. The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 subrequirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently enforceable version; from Order No. 786). This subrequirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address the Commission's concerns, recommendations from the Joint Report, and satisfy the objective of the SAR, regarding the single points of failure in Protection Systems.

2. Should the drafting team decide to categorize a P8 contingency as a Planning Event, the drafting team should consider expanding the applicability of the standard to include those functional entities from which the Transmission Planner (TP) must receive system protection data: Generator Owner (GO), Transmission Owner (TO), and Distribution Provider (DP). Because a non-vertically integrated Planning Cooridnator (PC) or TP (e.g., an RTO/ISO) must receive and coordinate system protection data from the GO, TO, and DP in order to satisfy the planning requirements, the standard should be revised to include data submission requirements for the GO ,TO, and DP. The proposed standard's reliance on MOD-032 as a means to receive system protection data is insufficient because MOD-032 does not specifically require such data be provided to the TP.

Comment	
The focus of the contingencies must be on the likelihood of them happening. P8 contingencies consist of a three-phase fault plus non-redundant component of a protection system failure to operate. Oncor's transmission system experiences very low instances of three-phase faults as compared to single-phase faults. In addition, a three-phase fault with non-redundant component of a protection system failure to operate is even more rare. The likelihood or probability of a P8 contingency occurring is so low that Oncor believes it would not be practical both from an engineering and economical standpoint to elevate this event to a P level contingency. It better fits in the extreme event category.

We agree with the creation of the proposed P8 event. However, in our view, following a P8 event the tripping of a circuit due to a generator pulling out of synchronism should be permissible as long as it doesn't result in cascading or uncontrolled separation. The proposed standard requires that for the P8 planning event, "The System Shall remain stable" and "Cascading and uncontrolled islanding shall not occur". However, since, there isn't a common understanding of what the system remaining stable means, we suggest including the following sub-requirement in the standard for additional clarity:	

4.1.4. For planning events P8: When a generator pulls out of synchronism in the simulations, the resulting apparent impendace swings shall not result in Cascading. Alternatively, a similar clarification as our proposed sub-requirement 4.1.4 can be added to Condition (a) on top of Table 1 as follows: **a) For P0 through P7 events, the System shall remain stable, and Cascading and uncontrolled islanding shall not occur. For P8 event, Cascading shall not occur.**

Yes. We agree with adding the proposed P8 event with the understanding that Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES, then if needed, the corresponding SLG fault contingency. More specifically, the need to simulate a subsequent SLG fault of the corresponding contingency would be only if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss or Cascading. It is also expected that there will be "extremely few," or more likely "no", SLG fault contingencies that would result in more severe impacts than the corresponding 3-phase fault contingencies. Please see comment for Footnote 14 in the responses to Question 4. It is difficult to ascertain the simulation performance requirement for P8 events. To help clarify these performance requirements for the proposed P8 events, suggest inserting R4.1.4 that reads: For planning event P8, the System shall remain stable, and Cascading and uncontrolled islanding shall not occur.

Comment	
The proposed revisions to the Steady State and Stability performance requirements in Table 1 imply that a P8 event must not result in Cascading, instability, and islanding. This exceeds the SDT's original intent to require development and implementation of a CAP to avoid Cascading only.	

To remove the performance requirements for instability and islanding for a P8 event, ERCOT suggests the following wording changes to Condition (a): (a) For P0 through P7 events, the System shall remain stable, and Cascading and uncontrolled islanding shall not occur. For P8 event, Cascading shall not occur.

CHPD appreciates the effort of the SDT to address the directives from FERC Order No. 786, and the recommendations in response to Order No. 754 from the SPCS and the SAMS regarding the assessment of protection system single points of failure (Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request ("Joint Report")).

Indeed, the primary goal of the Standards Authorization Request (SAR) is to implement the recommendations in the Joint Report. However, the Joint Report states that "***probability of three-phase fault with a protection system failure is low enough that it does not warrant a planning event.***" As such, we believe that the proposed addition of the P8 planning event is overreaching and beyond the scope of the SAR.

The Joint Report does acknowledge *"the existence of a reliability risk associated with the single points of failure in protection system that warrants further action"* and therefore recommended additional emphasis in planning studies to assess three-phase faults involving protection system single points of failure (Joint Report, ***Chapter 3 – Conclusion***, pg. 11). Accordingly, the SAR defined the scope of the SDT's work to specifically address only the recommendations from the Joint Report. However, the proposed P8 event falls outside the scope of the SAR because R2.7 requires the Planning Assessment to have a Corrective Action Plan (CAP) if the "analysis indicates an inability of the System to meet the performance requirements in Table 1" which includes the P8 event.

With the exception of the proposed R4.5 in draft 2 (Sept. 2017), the SDT addressed all of the recommendations from SPCS and SAMS regarding single points of failure in protection systems in the Joint Report. The clarification of relay to components of a Protection System with the modified Footnote 13 to clarify P5 and extreme events – stability 2e-2h was a significant improvement to the proposed TPL-001-5.

The proposed Footnote 13 in draft 3 (Mar. 2018 version) should be kept. The deleted portions under Requirement R4 sub-requirement 4.5 in draft 3 should not be deleted, i.e., this sub-requirement should be kept intact from the original TPL-001-4 (the currently

enforceable version; from Order No. 786). This sub-requirement 4.5 together with clarified P5 (Table 1), extreme events – stability 2e-2h (Table 1, from draft 2) and the clarified Footnote 13 will adequately address FERC's concern, recommendations from the Joint Report as well as the SAR regarding the single points of failure in Protection System.

Teresa Cantwell - Lower Colorado River Authority - 5	
Answer	No
Document Name	
Comment	
This change appears to require the creation of a model for every outage, without regard for the length of the outage. The requirement is already part of the performance standard through the application of P5 contingencies. The revision as proposed would require a proliferation of cases be developed and maintained and lead to confusion about which case to use. The development of cases for known outages seems appropriate for the operational time horizon but impracticle for the long-term planning time horizon. Reliability of the system during outages in the long-term planning horizon can be studied appropriately through the development of contingencies accompanied with appropriate generation adjustments to be applied to individual known outages within the seasonal period defined by a planning case as opposed to developing a seperate case for each combination of known outages. Further, the changes proposed under 2.1.3 create confusion around which P1 events need must be studied.

Response	
The SDT agrees that analyses conducted for Table 1 Planning Events (P3 and P6) result in the same topology as modeling a known planned outage and then simulating P1 events. While the resultant topology may be the same, the performance criteria are different. This comment illustrates that the analysis performed for Near Term Planning Assessments are is often intertwined. The analysis performed for a P3 or P6 event, as well as results of previous planning assessments may be used to inform the planner about the effect of a known planned outages that are coupled P1 events. P5 are single-phase delayed-clearing contingencies. Modeling such contingencies may help in some, but not all scenarios – it is not a replacement for modeling maintenance outages with a single contingency on an adjacent facility.

FERC Order No. 786 was explicit that the TPL standard must address known maintenance outages in the Near Term Planning Horizon Assessments. The range of industry comments reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these known maintenance outages. The SDT recognizes a variety of factors such as MW load, topology, and facility ratings can be used as qualifying criteria for inclusion of know maintenance outages. However; other factors (as contained in the entity's procedures) can also be employed. Past studies as well as other P events (P6, P3) can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments. Examples of other factors to be considered are enumerated in Requirement R2, Part 2.1.3 and R2.4.3. As modified these requirements provide flexibility for companies to determine their own set of parameters, as a continent-wide procedure is not feasible nor does it address the needs of each region's own unique system.

Comment	

The SPP Standards Review Group recommends the drafting team add clarifying language to subparts 2.1.3 and 2.4.3 that specifies how the PC and TP should assess and perform the required studies.

Recommendation:

The following revised language for subparts 2.1.3 and 2.4.3 will provide clarity and eliminate ambiguity how analysis is performed with respect to the subparts previously mentioned (see as follow):

Subpart 2.1.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the Bulk Elextric System (BES), with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, ***as selected in Part 2.1.1 and 2.1.2***, when known outages are scheduled."

Subpart 2.4.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, ***as selected in Part 2.4.1 and 2.4.2***, when known outages are scheduled."

Comment
We believe the proposed change should be simplified as a procedure or technical rationale that identifies what is a known outage should not be embedded within this requirement. The requirement focuses on maintaining system models, not developing procedures or technical rationales. These models must be based on data consistent with NERC Reliability Standard MOD-032-1, Corrective Action Plans, and other data sources. We recommend the SDT follow the acceptable approach suggested within the FERC directive that identifies significant planned outages can be based on registered entity-selected facility ratings or other parameters for inclusion within system models.

CenterPoint Energy believes the language in Requirement R1.1.2 could lead to confusion as to which outages are required to be studied. FERC Order 786, paragraph 43 identifies "decreasing the outages to fewer months to include additional significant planned outages" as an acceptable approach. CenterPoint Energy recommends the SDT reconsider this approach and identify a 3-month threshold to capture the outages over which FERC was concerned.

Response	
According to the FERC Order No. 786, there is no direct correlation between the time duration of an outage and system impact. A shorter duration outage may be more impactful to the system than a three-month outage. The range of industry comments reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these known maintenance outages. A three-month outage duration would ignore the basic differences in network topology, load level, and load shape of each region and entity. Outage duration can be one of the criteria, but not the only criterion. Examples of other factors to be considered are enumerated in Requirement R2, Parts 2.1.3 and 2.4.3.

We agree with removing the Reliability Coordinator from this standard as the responsibility of the RC is "operation" of the system. Also, we believe that using an established procedure or technical rationale to potentially idenifty outages is a step in the right direction. The concept of known or planned outages in TPL-001-5 needs to have a footnote or further explanation to clarify that this applies to "outages needed to execute the CAP" and be very specific. Also, long term planned generation outages may need to be included. However, maintenance outages should not be addressed in this TPL standard. Maintenance outages are typically not known much more than 6 months out and are assessed by Operations Planning, under TOP and/or IRO standards, closer to the desired time of the maintenance outage such that expected system conditions reflected in the study power flow is better known. Furthermore, since the "Near Term Planning Horizon" covers year 1 through 5, and maintenance outages are not scheduled this far out, then maintenance outages should be not be included in this standard. As such, the exclusion of maintentnace outages for this assessment should be stated in the standard. Therefore, we recommend that 1.1.2. be modified as follows:	

1.1.2 Known Expected outages of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Outage(s) shall be selected according to an established process or technical rationale that, at a minimum: 1.1.2.1 Considers any extended outages(s) that are expected during the implementation of identified Corrective Action Plans 1.1.2.2 Considers long term planned generation outages (outside of normal planned and scheduled maintence outage) 1.1.2.4 Does not exclude known transmission outage(s) soley based on the outage duration

Response
FERC Order No. 786 did not limit outages to exclude generation outages. FERC incorporated language to be more inclusive, however, the SDT does recognize that most known outages are scheduled during the Real-Time and Operations Planning Horizon. FERC Order No. 786 was explicit in that known outages in the Near-Term Planning Horizon need to be addressed. Based on industry comments the SDT deleted Requirement R1, Part 1.1.2 and modified Requirement R2, Parts 2.1.3 and 2.1.4 to provide clarity. The SDT recognizes a variety of factors such as MW load, topology, and facility ratings can be used as qualifying criteria; however other factors (as contained in the entity's procedures) can also be employed. Past studies as well as other P events (P6, P3) can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments. Examples of other factors to be considered are enumerated in Requirement R2, Parts 2.1.3 and 2.4.3.

We applaud removing the Reliability Coordinator from this standard as the responsibility of the RC is "operation" of the system. Also, we believe that using an established procedure or technical rationale to potentially idenifty outages is a step in the right direction.

The concept of known or planned outages in TPL-001-5 needs to have a footnote or further explanation to clarify that this applies to "outages needed to execute the CAP" and be very specific.   Also, long term planned generation outages may need to be included. However, maintenance outages should not be addressed in this TPL standard. Maintenance outages are typically not known much more than 6 months out and are assessed by Operations Planning, under TOP and/or IRO standards, closer to the desired time of the maintenance outage such that expected system conditions reflected in the study power flow is better known. Furthermore, since the "Near Term Planning Horizon" covers year 1 through 5, and maintenance outages are not scheduled this far out, then maintenance outages should be not be included in this standard. As such, the exclusion of maintentnace outages for this assessment should be stated in the standard.

Therefore, we recommend that 1.1.2. be modified as follows:

1.1.2 **Expected** outages of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Outage(s) shall be selected according to an established process or technical rationale that, at a minimum:

1.1.2.1 Considers any extended outages(s) that are expected during the implementation of identified Corrective Action Plans

1.1.2.2 Considers long term planned generation outages (outside of normal planned and scheduled maintence outage)

1.1.2.4 Does not exclude known **transmission** outage(s) soley based on the outage duration

Response	
As noted in FERC Order No. 786, known outages in the Near Term Planning Horizon encompass more than just the subset of outages identified in Corrective Action Plans. The SDT provided clarity via Requirement R2, Parts 2.1.3 and R2.4.3 defining parameters that focus the selection of known outages. However, the parameters are not so specific as to limit only those associated with the Corrective Action Plans, as this assumption is not supported by the FERC Order No. 786.

Texas RE appreciates the Standard Drafting Team's (SDT) continuing efforts to develop a workable definition to implement the Federal Energy Regulatory Commission (FERC) directive in FERC Order No. 786 to include planned maintenance outages of significant facilities in future TPL-001 planning assessments and eliminate the previous six-month bright line inclusion criterion. Texas RE particularly appreciates the SDT's reconsideration of developing a significant outage test based solely upon outages "selected in consultation with the Reliability Coordinator." However, Texas RE remains concerned that the current draft TPL-001-5 R1.1.2 language, if adopted, would be unworkable. Rather than the SDT's proposed approach, Texas RE instead recommends that the SDT require Transmission Planners (TP) and Planning Coordinators (PC) to identify and model known outages selected in accordance with an established procedure that (1) requires selection based on the MW or facility rating criteria identified by FERC in FERC Order No. 786; (2) provides a technical justification for the specific MW and facility rating threshold selected; and (3) does not exclude known outage(s) solely based upon the outage duration.

Texas RE's principal concern with the proposed TPL-001 language, as currently drafted, is that is appears circular. In particular, the proposed TPL-001-5 R1.1.2 first provides that planning models shall represent "[k]nown outages of generation or Transmission Facility(ies) . . . selected for analyses pursuant to Requirement 2, Parts 2.1.3 and 2.4.3 only." That is, the proposed TPL-001-5 R 1.1.2 appears to limit the scope of modeling requirements to a subset of analyses previously identified in TPL-001-5 R 2.1.3 and 2.4.3. TPL-001-5 R 2.1.3 in turn provides that qualifying studies shall include "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2." That is to say, the proposed TPL-001-5 R 1.1.2 appears to reference significant outages identified in the qualifying studies in TPL-001-5 R 2.1.3 while the required qualifying studies in TPL-001-5 R 2.1.3 will be based on those known outages identified in the established procedure set forth in TPL-001-5 R 1.1.2. As a result, the proposed language appears circular. That is, TP or PCs will not know which outages to select for their qualifying studies prior to identifying them using their established procedure. However, that procedure itself depends upon a prior identification of known outages in the qualifying study model run.

A similar issue exists in the proposed TPL-001-5 Foot. This section again requires studies of "P1 events . . . with known outages modeled as in Requirement R1, Part 1.1.2." However, will likely only be able to identify "known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events when concurrent with selected known outage(s)" by performing the analysis in TPL-001-5 R 2.4.3.

In lieu of adopting what appears to be a confusing and circular approach, Texas RE instead recommends that the SDT consider FERC's explicit invitation to define significant known outages based on parameters other than duration. In particular, FERC noted that NERC and the SDT could develop "parameters on what constitutes a significant planned outage based, for example, on MW or facility ratings." (FERC Order No. 786, P. 43). The SDT could implement such a directive by requiring TPs and PCs to select known outages according to an established procedure or technical rationale that, at a minimum, establishes criteria based on MW or facility ratings for significant known outages. Consistent with this approach, the SDT recommends considering revising the proposed TPL-001-5 R 1.1 along the following lines:

1.1 System models shall represent:

1.1.1. Existing Facilities;

1.1.2. Known outages(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1 Establishes a criteria, supported by a technical justification, for identifying significant known outages based on MW or facility ratings; and

1.1.2.2. Does not exclude known outage(s) solely based upon the outage duration.

Additionally, it is unclear whose "established procedure" per Part 1.1.4 is to be used, so additional clarification would be helpful.

KCP&L incorporates its response to Question 4.	
Likes 0	
Dislikes 0	
Response	
The SDT assumes the pertinent portion of the KCP&L comment to question 4 is to "include language that will allow establishing the scope of contingencies in dynamics to a specific area local to the equipment". To this issue the SDT has provided the capability to tailor the analysis to best fit a particular system. The SDT recognizes the range of industry comments reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these known maintenance outages. The regional differences reflect analysis that is tailored to best examine the system based on unique system characteristics. Accordingly the draft standard accommodates incorporating criteria such as MW, load, topology, and facility ratings to be used as qualifying criteria to identify which know planned outages are candidates for additional assessment as well as providing the flexibility to include other factors (as contained in the entity's procedures). Past studies, local dynamics, as well as other P events (P6, P3) can be used as limiting factors tailored to each entity's system when selecting known maintenance outages to include within the Near Term Planning Assessments and to put bounds on the extent of the assessment.

National Grid would like to express our appreciation and supports the direction in which the TPL-001-5 SDT is proposing to adjust the NERC Reliability Standard TPL-001 and provides the following comment for consideration: Generation or Transmission Facilities outages can be scheduled on a time scale shorter than the Near-Term Transmission Planning Horizon. If a Facility outage previously not studied is selected per guidance provided in R1.1.2 and the selected Facility outage occurs within the Near-Term Transmission Planning Horizon, would that prohibit use of past studies to support the annual Planning Assessment (as otherwise allowed per R2.6)?

Previous planning assessments may be used to inform the planner about the effect of known planned outages that are coupled with P1 events. Additionally, information from analyses conducted for Table 1 Planning Events (P3 and P6) result in the same topology as modeling a known planned outage and then simulating P1 events. While the resultant topology may be the same, the performance criteria are different. This comment illustrates that the analysis performed for Near Term Planning Assessments are is often intertwined and may be used to inform the planner about the effect of a known planned outages in the near term planning horizon.

We have two concerns with the proposed changes: • As currently proposed, the TPL standard only requires P1 events to be simulated when assessing planned outages in the Near-Term Transmission Planning Horizon. However, this is inconsistent with NERC FAC standard FAC-014-2 R6, which require the Reliablity Co-ordinator to consider multiple contingencies when assessing these outages. Therefore, at a minimum, when the Planning Co-ordinator is assessing planned outages occurring in the Near Term Transmission Planning Horizon, they should simulate the contingences that the Reliablity Co-ordinator would simulate when assessing and approving these outages. Hence we propose to replace the requirement to simulate P1 events in R2.1.3 and R2.4.3 with a requirement to simulate the contingencies as specified per R6 of the current FAC-014-2 standard. • The current proposed requirement for selecting outages does not completely address FERC’s order. FERC’s order mentions that planned outages should not result in ‘the loss of non-consequential load or detrimental impacts to system reliability’, whereas the current proposed approach only addresses the loss of non-consequential load.

We propose the following changes to Part 1.1.2, "Known outage(s) of generation or Transmission Facility(ies) planned to occur in the Near-Term Transmission Planning Horizon for applicable system conditions and year(s) selected by the Transmission Planner or and Planning Coordinator for analyses . . .":

- We suggest replacing the term, "scheduled", with the words, "planned to occur", because the term "scheduled" can be misinterpreted to apply only to outages that are approved and scheduled by Reliability Coordinators. On the other hand, the word "planned to occur" can refer to outages that TPs and PCs know need to be assessed in the planning horizon to implement identified Corrective Action Plans and Facility rebuilds, or know may be difficult or impossible to schedule in the operating horizon without the risk of exceeding System Operating Limits or risk of Non-Consequential Load Loss.

If the term "scheduled" is not replaced and is interpreted to apply only to outages that are approved and scheduled by Reliability Coordinators, then the NERC proposed Part 1.1.2.1 should be removed because Reliability Coordinators only approve scheduled outages in the planning horizon after they assessed for acceptable reliability impact for the applicable system conditions of the outage. So, there is no need to require Planning Coordinators and Transmission Planners to duplicate the assessment of the Reliability Coordinator's scheduled outages.

- We suggest adding, "for applicable system conditions and year (s)", to make clear that the selected outages are related to specific timeframes and are for real applicable system conditions.

• We suggest replacing "Transmission Planner and Planning Coordinator" with "Transmission Planner or Planning Coordinator" because each entity may have valid documented procedures or technical rationale for selecting appropriate outages that differ due to their specific perspectives and roles. We propose replacing Part 1.1.2.1 with previous proposed wording of, "Are selected in accordance with documented outage selection procedures or technical rationale". If this wording in not added to Part 1.1.2.1, then Part 1.1.2.1 is not a selection limiting criteria. All known outages would have to be evaluated to determine whether any of them are expected to result in Non-Consequential Load Loss for P1 events in Table 1. And since all known outages were studies, then Part 2.1.3 and Part 2.4.3 would have already been performed without any known outage selection limitations. Furthermore, the proposed Part 1.1.2 text does not address FERC's directive for "NERC to modify Reliability Standard TPL-001-4 to address the concern that the standard could exclude planned maintenance outages of significant facilities from future planning assessments…" [FERC Order 786, Final Rule, Item 3, page 5; Planned Maintenance Outages, pp. 29-37].

Comments: Addressing Order 786 without adding a tremendous amount of unnecessary study work is admittedly a difficult problem to solve. FMPA does not support the current draft language because it effectively requires that all outages, regardless of the duration, size or location of the facility (really regardless of any qualifier) must be studied. The reason for this is that non-consequential load shedding is rarely possible to identify without running the power system simulations. Thus in order for an entity to only study outages that cause non-consequential load shedding, that entity usually has to have already studied those outages. The suggested "filter" that the SDT is proposing requires that the Planner already know the result of the simulations. The proposed language introduces a standard requirement that, in practice, will result in entities being forced to "prove the negative" – that is, the focus will become defending how the Planner knew that certain outages would not cause non-consequential load loss.

FMPA asserts that some reasonable qualifiers must exist, and must be used in an attempt to avoid requiring entities to prove the negative. Furthermore, conducting Planning studies on very short duration outages is a waste of time since short duration outages are much more easily (and therefore almost always are) rescheduled in the operations horizon to avoid transmission system reliability risks that are possible. Focusing on longer outage durations increases the likelihood that system performance conditions observed in the studies might actually occur in real time and focuses the study work of the planners more on projects that increase the flexibility of the system (e.g. giving the Operators more tools in their toolbox), rather than on trying to guess at operations horizon conditions or emulate Operations horizon planning work.

Duke Energy disagrees that the proposed changes meet the directives. The changes go beyond the scope of changes directed in Order No. 786 and will make Planners responsible for evaluating all known scenarios, even outages of limited duration (e.g. 10 minutes?). Also, the standard lacks clarity on whether outages of a Protection System should be considered as well. The lack of specificity regarding outages of limited duration, requires a Planner to study almost every possible scenario Operators may face in the Near Term Planning Horizon. Further, the proposed changes appear to push the standard to a fill in the blank status because it simply requires creation of "an established procedure". The changes to 2.1.3 and 2.4.3 in addition to 1.1.2 appear to create circular logic to require Planners to know the seriousness of the consequences of a scenario they have yet to study.

We propose the following changes to Part 1.1.2, "Known outage(s) of generation or Transmission Facility(ies) planned to occur in the Near-Term Transmission Planning Horizon for applicable system conditions and year(s) selected by the Transmission Planner or Planning Coordinator for analyses . . .":

- We suggest replacing the term, "scheduled", with the words, "planned to occur", because the term "scheduled" can be misinterpreted to apply only to outages that are approved and scheduled by Reliability Coordinators. On the other hand, the word "planned to occur" can refer to outages that TPs and PCs know need to be assessed in the planning horizon to implement identified Corrective Action Plans and Facility rebuilds, or know may be difficult or impossible to schedule in the operating horizon without the risk of exceeding System Operating Limits or risk of Non-Consequential Load Loss.

If the term "scheduled" is not replaced and is interpreted to apply only to outages that are approved and scheduled by Reliability Coordinators, then the NERC proposed Part 1.1.2.1 should be removed because Reliability Coordinators only approve scheduled outages in the planning horizon after they assessed for acceptable reliability impact for the applicable system conditions of the outage. So, there is no need to require Planning Coordinators and Transmission Planners to duplicate the assessment of the Reliability Coordinator's scheduled outages.

- We suggest adding, "for applicable system conditions and year (s)", to make clear that the selected outages are related to specific timeframes and are not 'hypothetical' outages.

- We suggest replacing "Transmission Planner and Planning Coordinator" with "Transmission Planner or Planning Coordinator" because each entity may have valid documented procedures or technical rationale for selecting appropriate outages that differ due to their specific perspectives and roles.

We propose replacing Part 1.1.2.1 with previous proposed wording of, "Are selected in accordance with documented outage selection procedures or technical rationale". If this wording in not added to Part 1.1.2.1, then Part 1.1.2.1 is not a selection limiting criteria. All known outages would have to be evaluated to determine whether any of them are expected to result in Non-Consequential Load Loss for P1 events in Table 1. And since all known outages were studies, then Part 2.1.3 and Part 2.4.3 would have already been performed without any known outage selection limitations. Furthermore, the proposed Part 1.1.2 text does not address FERC's directive for "NERC to modify Reliability Standard TPL-001-4 to address the concern that the standard could exclude planned maintenance outages of significant facilities from future planning assessments…" [FERC Order 786, Final Rule, Item 3, page 5; Planned Maintenance Outages, pp. 29-37].

Comment	

The changes meet the FERC directive but is restrictive on the transmission Planner/Planning Coordinator. In TPL-001-4, only outages 6 months or greater in the Planning Horizon needed to be considered. Requirement R1.1.2.2, as now written, does not permit exclusion solely based on outage duration, which means even one day or one hour outages that are in the near-term Planning horizon cannot be excluded. Perhaps the drafting can consider permitting exclusion of known outages based on some minimum duration (eg. outages less than 1 month maybe excluded, outages between 1 and 6 months may only be excluded if they are not expected to result in non-consequential load loss for P1 events, all outages greater than 6 months shall be included). This makes expectations more clear and avoids the need to develop a technical rationale.

We propose the following changes to Part 1.1.2, “Known outage(s) of generation or Transmission Facility(ies) planned to occur in the Near-Term Transmission Planning Horizon for applicable system conditions and year(s) selected by the Transmission Planner or and Planning Coordinator for analyses . . .”:

We suggest replacing the term, “scheduled”, with the words, “planned to occur”, because the term “scheduled” can be misinterpreted to apply only to outages that are approved and scheduled by Reliability Coordinators. On the other hand, the word “planned to occur” can

- refer to outages that TPs and PCs know need to be assessed in the planning horizon to implement identified Corrective Action Plans and Facility rebuilds, or know may be difficult or impossible to schedule in the operating horizon without the risk of exceeding System Operating Limits or risk of Non-Consequential Load Loss.

If the term “scheduled” is not replaced and is interpreted to apply only to outages that are approved and scheduled by Reliability Coordinators, then the NERC proposed Part 1.1.2.1 should be removed because Reliability Coordinators only approve scheduled outages in the planning horizon after they assessed for acceptable reliability impact for the applicable system conditions of the outage. So, there is no need to require Planning Coordinators and Transmission Planners to duplicate the assessment of the Reliability Coordinator’s scheduled outages.

- We suggest adding, “for applicable system conditions and year (s)”, to make clear that the selected outages are related to specific timeframes and are for real applicable system conditions.

- We suggest replacing “Transmission Planner and Planning Coordinator” with “Transmission Planner or Planning Coordinator” because each entity may have valid documented procedures or technical rationale for selecting appropriate outages that differ due to their specific perspectives and roles.

We propose replacing Part 1.1.2.1 with previous proposed wording of, “Are selected in accordance with documented outage selection procedures or technical rationale”. If this wording in not added to Part 1.1.2.1, then Part 1.1.2.1 is not a selection limiting criteria. All known outages would have to be evaluated to determine whether any of them are expected to result in Non-Consequential Load Loss for P1 events in Table 1. And since all known outages were studies, then Part 2.1.3 and Part 2.4.3 would have already been performed without any known outage selection limitations.

Furthermore, the proposed Part 1.1.2 text does not address FERC's directive for "NERC to modify Reliability Standard TPL-001-4 to address the concern that the standard could exclude planned maintenance outages of significant facilities from future planning assessments…" [FERC Order 786, Final Rule, Item 3, page 5; Planned Maintenance Outages, pp. 29-37].

Based on industry comments, the SDT deleted Requirement R1, Part 1.1.2 and modified Requirement R2, Parts 2.1.3 and 2.1.4 to provide clarity. When doing so, the SDT incorporated the changes in the revised wording including changing "schedule outage" to "known outage", and "Transmission Planner and Planning Coordinator" to "Transmission Planner or Planning Coordinator". FERC Order No. 786 was explicit that the TPL standard must address known maintenance outages in the Near Term Planning Horizon Assessments. The range of industry comments reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these known maintenance outages. The SDT recognizes a variety of factors such as MW load, topology, and facility ratings can be used as qualifying criteria for inclusion of know maintenance outages. Examples of other factors to be considered are enumerated in Requirement R2, Parts 2.1.3 and 2.4.3. As modified these requirements provide flexibility for companies to determine their own set of parameters, as a continent-wide procedure is not feasible nor does it address the needs of each region's own unique system.

NVE recommends that R1.1.2 be modified to include outages that span the season being studied. For outages in the season being studied that are less than the entire span of the season, the Transmission Planner should be able to select which outage to study based on when in the study season the outage is to occur and the significance of the generation or transmission facilities involved in the outage for the area of the system they are located in.

OG&E recommends the drafting team add clarifying language to subparts 2.1.3 and 2.4.3 that specifies how the PC and TP should assess and run the required studies.

Recommendation:

The following revised language for subparts 2.1.3 and 2.4.3 will provide clarity and eliminate ambiguity how analysis is performed with respect to the subparts previously mentioned (see as follow):

Subpart 2.1.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the Bulk Elextric System (BES), with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, **as selected in Part 2.1.1 and 2.1.2**, when known outages are scheduled."

Subpart 2.4.3 (Proposed language)

"P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions, **as selected in Part 2.4.1 and 2.4.2**, when known outages are scheduled."

Comments: Other options could better address concerns in the FERC directive order No 786. The requirement to study outages of any duration in the Near Term Planning Horizon creates burden on the planning process to address the scheduling of outages rather than adequacy of BES infrastructure. Transmission planning is expected to determine performance deficiencies of the system and to mitigate them with planning solutions. Studying impacts of outages with 2 independent unplanned events on top of it would require the creation of additional base cases for (1) each outage in the 1-5 year horizon, or (2) creating cases which encompass all anticipated outages in a season. Next, one would then need to perform all analyses on top of such outages that would be included in the base cases. This essentially creates another layer of contingency analysis which can result in selective N-1-1-1 or more events deep depending on the method used. The results would likely be that impacts could be mitigated by: (a) scheduling appropriately to ensure outages do not overlap, or (b) moving outages into different seasons.

Unintended consequences could result. One example, although unlikely, would be proposing the construction of a transmission project that is built to allow for an outage of a facility for maintenance/rebuild which may be a rare outage occurrence itself. This project just adds a selective 3rd layer of transmission redundancy to the system to allow for reliable system operation during an outage if up to 2 other unplanned events occurred. While this exercise may be of importance to the scheduling of outages and identification of impacts of outages and contingencies, it is best handled by operations planning (operating horizon) which should instead handle the study and scheduling of planned outages beyond the operating horizon and into the Near Term Planning.

Alternative Draft wording for Requirement 1, Part 1.1.2 is provided below.

1.1.2. Known outage(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum: **1.1.2.1.** Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with the selected known outage(s); **1.1.2.2.** Considers outage duration(s) but does not exclude known outage(s) solely based upon their duration; **1.1.2.3.** Considers the significance of the generation and Transmission Facility(ies) involved in the known outage(s) for the area of the system in which they are located; and **1.1.2.4.** Considers the expected load levels during the known outage(s).

NIPSCO believes any potential issues associated with planned maintenance outages are best identified through operational studies such as real time, next-day, and seasonal analysis rather than through the annual TPL-001-4 system performance analysis. Planned maintenance outages are almost always of short duration and are commonly scheduled to avoid occurrence during critical peak seasons.	

Only planned maintenance outages which are reasonably expected to occur during critical peak seasons, such as those six months or longer, should be included in the annual TPL-001-4 system performance analysis. Removing the existing six month threshold for planned maintenance outages and continually reducing the time of duration requires the analysis of an ever greater number of concurrent generator and line outages beyond any specified in the TPL-001-4 standard including (P2) bus+breaker fault, (P4) stuck breaker, and (P7) common tower. This moves the performance analysis requirements of the TPL-001-4 standard closer to an effective N-2 requirement, which is currently an Extreme event, which was never intended.

R1.1.1.2 requires planners to include known generation and transmission facility outages scheduled within the Near-Term Transmission Planning Horizon and to select the outages studied according to an established procedure or technical rationale. The requirement also states that outages should not be excluded solely based on outage duration. FERC Order 786 states that acceptable approaches for	

addressing the outage concern include decreasing the threshold to fewer months or including parameters for identifying “significant planned outages” (page 33). Planners should review planned outages for the season under study and use technical rationale to determine whether an outage should be included or excluded from the study. Per FERC Order 786, planners should have the flexibility to exclude outages based on their technical rationale. Outages not deemed significant for the TPL assessment will be included in operations studies as the outage approaches. CHPD has three concerns related to this proposed language regarding known outages in R1.1.2.: 1. The nature of the outage, i.e. scope of work, has an effect on the system but the transmission planners do not necessarily know how a facility will be removed from service. For example, for maintenance of a relay system, there are many options for performing the maintenance with impacts ranging from delayed clearing to no system impact at all: 1) simply take the maintenance outage with all other systems energized (relying on delayed clearing); 2) take the local terminal out of service (likely eliminating the delayed clearing risk); or 3) bypass the normal breaker and relays and feed the line from a bus tie or transfer breaker. CHPD requests the standard provide coordinators with flexibility to assume the scope and nature of outages. 2. For overlapping, un-coordinated outages, the Planning Authority or Transmission Planner should be given authority to, when appropriate, move the outages for the purposes of the planning study so they do not overlap. This activity is frequently performed for outages in the Operations Timeframe, but no construct exists to do this for outages in the Planning Horizon. The proposed Standard should provide such a construct. 3. For situations in which new infrastructure for a Corrective Action Plan cannot be built prior to an outage, e.g., an outage scheduled in 1.5 years requires a capital project that will take 3 years to build, the proposed Standard should allow for the interruption of firm transmission service. FERC’s concern was that properly planned outages should not lead to load shedding. FERC Order 786, paragraph 41. Allowing for interruption of firm transmission will allow critical outages to be taken while avoiding non-consequential load loss.

These are planning studies, not operating studies. Outage coordination studies are currently done by the operations department as part of operations seasonal planning. Adding outage coordination studies to the Near Term Planning Horizon [1-5 years] will increase the planning work load without any real reliability improvement. The reason being that planned outages are currently part of transmission planning in both the Near and Long Term Horizons. It is a matter of understanding the steady-state contingency results. When looking at future system behavior, N-2 steady-state contingency analysis will reveal system performance with a single BES element out of service followed by a P1 event. Two element are out of service N-2. This is only a starting point. When N-2 contingency analysis does not show any performance violations, the system should be able to remove BES elements from service without issue. If a performance violation is found, then further analysis is required (N-1-1). We do not need a new requirement. If the requirement is added, the stability portion should be removed. Including stability analysis to the requirement will make it overly burdensome and will not improve reliability. Stability analysis software is not well suited for automation and the TPs and PCs can not reasonably be expected to perform stability analysis for every valid P1 contingency for each possible BES outage. The language of the requirement calls for contingencies which are "expected to produce more serverer system impacts". The only way to know the expected stability impact is to study it. Therefore, the requirement actually requires all planned outages to be studied using stability analysis and then to use those results to support the selection of a contingency subset to be studied. This is a circular argument. Stability analysis of planned is not needed for reliability.

FERC Order No. 786 clarified that the TPL Near-Term Planning Assessment is a required and beneficial analysis. Specifying particular outage duration would ignore the basic differences in network topology, load level, and load shape of each region and entity. Outage duration can be one of the criteria, but not the only criterion. Additionally, MW, load, topology, and facility ratings can also be used as qualifying criteria; however other factors (as contained in the entity's procedures) can also be employed. Past studies as well as other P events (P6, P3) can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments. Examples of other factors to be considered are enumerated in Requirement R2, Parts 2.1.3 and 2.4.3. FERC Order No. 786 did not limit outages to exclude dynamic assessments. FERC incorporated language to be more inclusive, however, the SDT does recognize that most known outages are scheduled during the Real-Time and Operations Planning Horizon.

Comment	
Tri-State partially agrees but has some reservations regarding the specific language and overlaps with existing P3 and P6 contingency categories. Requirement 1.1.2.2 runs counter to Requirement 1.1.2 which allows outage selection based on technical rationale. Technical rationale would include time-dependence. The inclusion of major outages regardless of time duration effectively adds an outage coordination aspect to performing the TPL assessment. Outage coordination is already performed by Transmission Operations. Requirement 1.1.2 effectively describes a category P3 or P6 contingency.

AZPS respectfully asserts that the proposed criteria under Requirement R1, Part 1.1.2 presents an overly complicated response to the Commission's directive in Order 786, Paragraph 43. Specifically, the Commission's directive allowed for the response to the directive to be a simple reduction of the 6 month time period. Such reduction would provide objective criteria for the entire industry to utilize to determine whether or not planned outages should be included in their planning assessment. AZPS is concerned that the proposed criteria under Part 1.1.2 is subjective in nature and could result in the potential for inconsistency relative to the inclusion of outages in planning assessments, e.g., outages of three (3) months or less could be implicated by some entities despite such outages creating unnecessary study burden with little to no reliability benefit wherein other entities could exclude such short-term outages. To ensure that the criteria provides more objectivity relative to the inclusion of outages in planning assessments, which would increase the overall consistency and value of planning assessments generally, AZPS recommends that the SDT reconsider the currently proposed criteria and replace it with criteria that requires outages to be included where such outages meet a definitive time period of "more than 3 months." AZPS respectfully asserts that short term outages should be studied and prepared for in the Operating horizon and not in a planning assessment and, further, that the potential for inconsistency between planning assessments would reduce the proposed reliability benefit anticipated by the currently proposed criteria. For these reasons, AZPS recommends replacement of the currently proposed criteria with a simplified criteria requiring inclusion of outages that are anticipated to last more than three months.

BPA appreciates that the reference to consultation with the Reliability Coordinator has been removed and that "Transmission" was added to Near-Term Transmission Planning Horizon. For R1.1.2.2 BPA does not believe it would be reasonable to require justification for every known outage that is not included. The way R1.1.2 is written, it seems to imply that an outage excluded based on duration should also not meet the established procedure or technical rationale.

The language in Part 1.1.2 is fine; however the language added to R2 Parts 2.1.3 and 2.4.3 that is referenced in Part 1.1.2 is confusing. Page 8 of the posted Technical Rationale document contains the rationale for changes to R2 Parts 2.1.3 and 2.4.3:

"Consistent with FERC's directive, the drafting team modified Requirements **R2 Parts** 2.1.3 and 2.4.3 to further recognize the intent to limit required study to only those known outages that are expected to produce severe System impacts on the PC/TP's respective portion of the BES."

LSPT agrees with this rationale. However, the changes to Parts 2.1.3 and 2.4.3 do not accomplish this objective. Since both 2.1.3 and 2.4.3 have the same added language, the concern is illustrated in 2.1.3 only, which states the following regarding the analysis required by the Planning Coordinator or Transmission Planner, with the added language bolded:

2.1.3. P1 events in Table 1 **expected to produce more severe System impacts on its portion of the BES**, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

The proposed change allow the PC/TP to **not** evaluate all P1 events; the PC/TP must only evaluate those P1 events in Table 1 "expected to produce the most severe System impacts on it portion of the BES." In other words, the P1 events in combination with "known outages" that produce the most severe System impacts may be a different set of P1 events..

LSPT's proposed changes to 2.1.3 (and correspondingly to 2.4.3) will correct this unintended consequence:

2.1.3. P1 events in Table 1, with known outages **that are expected to produce more severe System impacts on its portion of the BES** modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.

OUC believes the proposed Requirement 1.1.2. leaves too large of ambiguity in what needs to be tested. The intent of what is required to be tested is not clear, and appears on the surface to overlap significantly with the Operations Planning realm. The current standards provide enough parameters to include outages into the base case (using the 6 month outage duration as a threshold). The proposed changes reads as if it's requiring long-term transmission planners to study operational planning studies under the "Near-Term Transmission Planning Horizon". OUC does not believe the TPL requirements should include operational planning studies that should otherwise be included under the TOP standards (i.e. TOP-002-4). By not defining an outage duration, the requirement now appears to welcome any and all outage scenario testing, which should otherwise be completed under the TOP standards. Although Requirement 1.1.2.1 was added to limit the outages selected, for most it would be unclear what scenarios would result in non-consequential load loss, thus not providing enough of a parameter to limit the outages needed to be tested. Suggestion: OUC would suggest keeping the outage length as a parameter in order to filter the outages that should be studied in the Near-Term Planning Horizon. In understanding the 6 month outage duration not being inclusive of what the drafting team may be looking for, perhaps limiting the outage duration to 3 months would include enough of the key outages that should be studied, while not including all outages which would otherwise need to be analyzed under Operations Planning scenarios.

Based on industry comments, the SDT deleted Requirement R1, Part 1.1.2 and modified Requirement R2, Parts 2.1.3 and 2.1.4 to provide clarity. The range of industry comments reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these known maintenance outages. Past studies as well as other P events (P6, P3) can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments. Examples of other factors to be considered are enumerated in Requirement R2, Parts 2.1.3 and 2.4.3. Parts 2.1.3 and 2.4.3 enumerate criteria that can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments.

As proposed, we believe that R1.1.2.1 involves the creation of hypothetical outages to evaluate and include in the transmission assessment.

From the Order 786, paragraph 42, "The Commission's directive is to include known generator and transmission planned maintenance outages in planning assessments, not hypothetical planned outages." Most transmission maintenance outages are scheduled in the operating horizon, after considerable review and analysis of expected system conditions in the operating horizon. These outages may be daily, weekly, or of longer duration, but still they are planned and scheduled in the operating horizon and not the planning horizon. Therefore, from a planning perspective, few if any transmission outages will be included in the base case peak or off-peak models for analysis and development of the Planning Assessment because these maintenance outages have not been scheduled in the planning horizon.

The Commission goes on to state in paragraph 44 that "these potential planned outages must be addressed, so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon". In other words, the Commission wants us to speculate on the start and stop times of the maintenance outages, effectively creating hypothetical outages to consider for analyses. From our perspective the language of this paragraph of Order 786 is ambiguous. The Commission also stated in paragraph 44 that category P3 and P6 contingencies do not cover generation and transmission maintenance outages, but during the webinar, it was suggested by a member of the standard drafting team that the allowance of system adjustments following the planning maintenance outage event was the reason for FERC's disapproval. Is it the drafting team position that if the analyses were performed without system adjustments between the outage events, then FERC would not object? We did not read that response in Order 786 and request that the Standard Drafting Team provide reference that analyses of P3 and P6 events without system adjustment, other than make-up power, would provide an acceptable method for determining system adequacy during maintenance, planned or hypothetical, outages. However, we question why generation redispatch or other operating guides cannot be developed, if needed, to facilitate the performance of maintenance outages in the planning or operating horizons.

Response	
FERC Order No. 786 is explicit in that only known outages must be studied, not hypothetical outages. FERC Order No. 786 did not limit outages to exclude generation outages. FERC incorporated language to be more inclusive, however, the SDT does recognize that most known outages are scheduled during the Real-Time and Operations Planning Horizon. FERC Order No. 786 was explicit in that known outages in the Near-Term Planning Horizon need to be addressed. Past studies as well as other P events (P6, P3) can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments. Examples of other factors to be considered are enumerated in Requirement R2, Parts 2.1.3 and 2.4.3. Parts 2.1.3 and 2.4.3 enumerate criteria that can be used as limiting factors in selecting known maintenance outages to include within the Near Term Planning Assessments, and to lessen the ambiguity of the FERC Order. The SDT has incorporated language in Requirement R2, Parts 2.1.3 and 2.4.3 that provides flexibility for companies to determine their own set of parameters, as a continent-wide procedure is not feasible nor does it address the needs of each region's own unique system.	

The SDT should not and cannot provide clarity behind the reasoning of FERC. The webinar question referenced in your comment was regarding using basecase adjustments prior to replicating P1 events, which is permitted. In the Webinar, one example of what is different between performance requirements of a P1 vs. P6 was given as “system adjustments are allowed”, another example of a difference between performance requirements is load drop is allowed for a P6 and not allowed for a P1. It should not be assumed that one example given in the webinar between performance requirements of a P1 vs. P6 is the only reason why a P6 is insufficient.

Comment

Requirement 1, Part 1.1.2.1., does not provide a clear demonstrable criterion for outage selection. In order to conclusively determine “expected” Non-Consequential Load Loss during an N-2 event, studies must be performed to determine the response of the system. Therefore, this requirement, as written, implies that the Transmission Planner must consider *all* known outages. In Order 786, paragraph 43, FERC suggested that a selection parameter of facility ratings could be used. Use of a facility rating threshold in the standard would provide needed clarity to Transmission Planners and result in greater consistency.

3. ***Do you agree with the proposed implementation plan?***	
Joe McClung - JEA - 3,5 - FRCC, Group Name JEA Voters	
Answer	No
Document Name	
Comment	

The 36-months period for the proposed standard to become effective seems to be adequate along with an additional 24-months period for the development of CAP for the newly identified issues only with new P5.

However, we do not agree with the overall Implementation Plan. The P8 event proposal is out of scope based on our response for Q1. Therefore, JEA does not agree with the development of CAP for P8 either. There should not be a performance requirement for an extreme event and hence no CAP needs to be mandated. If the analysis for the extreme events with the clarified Footnote 13 with the single points of failure concludes there is Cascading, the PCs and TPs shall conduct an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences. This is already required today for compliance with the Requirement R2 sub-requirement 4.5 of TPL-001-4. Any development of CAP and its implementation plan for such an extreme event should be at the discretion of the individual entities.

We agree with the performance requirements for the updated P5 event. However, we do not agree with the 96-months period to meet the performance requirements for the newly identified issues with the proposed P5 events. As the SDT has acknowledged, the only way to meet the performance requirements for P5 events with single points of failure in Protection System will mostly be a capital improvement project to be installed at the identified substation(s). Even though performing the studies/analyses and the development of CAPs are within PCs' and TPs' control, they do not have any control in implementing the CAPs. The amount of capital improvement budget available, the outage coordination amongst various parties (GO, GOP, TO, TOP, system operators and even RCs), project scheduling as well as the availability of manpower to actually implement the CAPs at the substations with a sudden influx of work outside the routine job are numerous facets of the project implementation beyond the control of PCs and TPs. The size of the utility and the

number of CAPs to be implemented can create additional different challenges for different types of utilities such as co-ops, municipals, IOUs etc. in different regions/markets (ISO/RTO/vertically integrated etc.) **Suggestion**: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, JEA recommends for NERC to survey the industry (PCs, TPs and Facility owners) with another **Request for Data Under Section 1600 of the NERC Rules of Procedure** for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual **ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP)**.

Based on our preliminary review and our existing resources, the amount of time needed to develop new contingencies and perform new studies for new 'known outages' and 'non-redundant' Protection System components requirements will require substantially more time than the 36-month timeframe proposed in the implementation plan. So, we propose that the 36-month timeframe to perform these tasks be extended to a 60-month timeframe.

Duke Energy does not agree with the proposed Implementation Plan. Depending on system conditions, it is anticipated that when using Dynamic Load Modeling, that an entity could see a great number of its Facilities fail the performance requirements. Failure of the performance requirements could result in significant upgrades, which take time to implement. With the potential for significant upgrades to a majority of applicable Facilities, Duke Energy cannot agree with the Implementation Plan proposed.

Louisville Gas and Electric Company and Kentucky Utilities Company (LKE) supports providing Planning Coordinators (PCs) and Transmission Planners (TPs) 36 months until the effective date of the Standard to develop a procedure or technical rationale for selecting known outages of generation and Transmission Facilities, a process for establish coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis, and additional base case models and analysis. However, LKE believes that requiring “the planned System [to] continue to meet the performance requirements in Table 1 until 96 months after the effective date of Reliability Standard TPL-001-5” is too long. The three years before the effective date plus 8 years is 11 years. Other NERC standards do not have an 11 year time frame to fix an identified reliability risk to the BES.

KCP&L recommends extending to 60-months the preparation period prior to the effective date of the Standard.

In the alternative, provide flexibility or a process to extend the 36-month period based on the TP and PC's evaluation to implement the revised TPL-001-5 Standard.

Concern

The proposed Implementation Plan's time periods do not fully consider the differences in system sizes, complexity, and design elements.

Additionally, with the Standard's assessment scope expansion, the periods offered in the Plan need to consider barriers entities face staffing or contracting for the qualified personal to complete studies and implement CAPs.

KCP&L identified activities it anticipates will be required under the Standard that make the Plan's time periods insufficient to complete implementation of the proposed Standard. Here is an example:

- Changing and updating contingency lists will extend beyond the 36-month period because of the complexity and size of the undertaking and required vetting.

Beyond a single implementation activity, the implementation of the revised Standard will require long-duration, contingent, inter-related activities that, taken individually may fall within the 36-month period but, to collectively complete all the activities, will extend beyond the 36-month period. For example:

1. The best-case scenario to update and test dynamics software will take at least 12-months. The estimated period is without consideration of challenges to:

- Schedule the software upgrade and testing;
- Incorporate the additional P8 events and the re-alignment of Extreme events into the software; and

- Address the many "small" changes that will affect the planning models and assessments.

The proposed revision's specific and required assessments are contingent on updating and testing dynamics software. The period to complete the upgrade and assessments we easily see extending beyond the 36-month proposed implementation period.

A 36-month period to complete required assessments seems arbitrary when placed against the wide spectrum of applicable systems. In consideration of system differences, we recommend the 60-month period or, in the alternative, a process to extend the period based on TP and PC's evaluation to implement the revised TPL-001-5 Standard.

Response

Thank you for your comments. The implementation plan has been revised and clarified based upon the comments received from the industry and removal of the P8 categories from the planning events. With the removal of the P8 categories, the SDT believes that the 36-month timeframe for initial assessment period is sufficient. To further clarify the implementation plan, the SDT has also added a diagram showing the timeline in the supporting documents.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Comment

Texas RE appreciates the SDT's efforts in putting together the proposed Implementation Plan. Texas RE notes that, in its experience, registered entities have had significant issues understanding and following implementation plans. Texas RE therefore strongly encourages the SDT to carefully review the proposed Implementation Plan to ensure that is not ambiguous, vague, or confusing to understand.

To that end, Texas RE notes two aspects of the proposed implementation plan that could lead to potentially significant industry confusion. First, Texas RE notes that in establishing the requirement to complete planning assessments 36 months following the effective date of the standard approval, the proposed Implementation Plan is silent regarding the specific Standard Requirements that are actually implicated. Texas RE recommends that the SDT not merely rely on references to "planning assessments," but actually insert specific references to the Requirements subject to the 36-month planning assessment compliance threshold to reduce any possible ambiguity. Second, the proposed implementation plan provides that the requirement to implement Corrective Action Plans (CAPs) to be "the first calendar quarter 84 months following applicable regulatory approval of TPL-001-4." The effective date of the FERC Order approving TPL-001-4 is December 22, 2013. As such, the CAP requirement would, on its face, be due on March 1, 2020. Because TPL-001-5 will not become effective for at least 36 months following any applicable regulatory approvals, this requirement would trigger *prior* to the effective date of the proposed TPL-001-5 Standard. This appears to be in error, and Texas RE suggests that the SDT revise this aspect of the implementation plan accordingly – perhaps by inserting a reference to TPL-001-5 instead of TPL-001-4.

In addition to these issues, Texas RE presently understands the implementation plan, as currently drafted, to provide the following glide path to full implementation of the proposed TPL-001-5 Standard:

First calendar quarter 36 months following regulatory approval.

· The effective date of the standard is the first day of the first calendar quarter 36 months following the effective date of the applicable governmental authorities order approving the standard. This date serves as a starting point for the implementation plan.

· In accordance with the Initial Performance section, applicable entities must complete the planning assessment without CAPs by the effective date of the standard, or 36 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes there is no requirement mentioned. In the interest of clarity and not being vague Texas RE strongly recommends the implementation plan specify which requirement this date refers to.

60 months following regulatory approval.

· In accordance with the Initial Performance section, applicable entities must develop any required CAPs under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13, items b, c, and d, and P8 by 24 months following the effective date of the standard, or 36 months plus 24 months, or 60 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes this is also indicated in the Compliance Date section.

For 84 months following regulatory approval

o Texas RE noted the issue with the standard version above in reference to the Note Regarding CAPs. Assuming this should indeed specify TPL-001-5, rather than TPL-001-4, CAPs applying to the specified categories of Contingencies and events identified in TPL-001-5, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Form Transmission Service.

132 months following regulatory approval

o In accordance with the Compliance Date section, entities have 96 months from the effective date to end the use of CAPs developed to address failures to meet Table 1 performance requirements for P5 and P8 events only. The way this is written indicates entities have 36 months following the effective date of the applicable governmental authorities order approving the standard *plus 96 additional months* to end the use of CAPs. Is it the SDT's intent that this be *132 months from the effective date of the applicable governmental authority's order*? This timeline seems excessively long and would unnecessarily burden registered entities to prove it is doing anything to support the reliable operation of the grid based on an assessment.

In addition to the two confusing aspects noted previously, Texas RE noticed additional areas in which this implementation plan lacks clarity.

· First, the implementation plan uses different but similar terms: Effective Date, Compliance Date, and Initial Performance Date. While implementation plans in the past have used Effective Dates to indicate the starting point at which all activities are based upon, the use of the Effective Date is inconsistent in this plan. The implementation plan calculates when applicable entities must do planning assessments from the effective date (must be by the effective date for planning assessments without CAPs) as well as it calculates when any required CAPs under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13, items b, c, and d, and P8 must be developed (24 months following the effective date). It is *not* used to calculate the date by which applicable entities must end their use of CAPs, nor is it used to calculate the date by which CAPs should not include Non-Consequential Load Loss and/or curtailment of Firm Transmission Service (see Note Regarding CAPs). This date is calculated based upon the effective date of the applicable governmental authority's order. To improve clarity, the effective date should be used consistently.

· Texas RE inquires as to the difference between the terms Compliance Date and Initial Performance Date. The Compliance Date section contains the same information as the second paragraph of the Initial Performance section. Are they intended to mean two different things since two different terms are used?

· It is also unclear to which requirements the actions refer. Are we to assume that if the requirement is not mentioned specifically, it is enforceable on the effective date of the standard?

Thank you for your comments. The implementation plan has been revised and clarified based upon the comments received from the industry and removal of the P8 categories from the planning events. To further clarify the implementation plan, the SDT has also added a diagram showing the timeline. In addition, by the time the TPL-001-5 becomes effective which is 36 months after the approval date TPL-001-4 would have met the 84-month period so there is no overlapping or confusion.

Comment	
The 36-months period for the proposed standard to become effective seems to be adequate along with an additional 24-months period for the development of CAP for the newly identified issues only with new P5. However, we do not agree with the overall Implementation Plan. The P8 event proposal is out of scope based on our response for Q1. Therefore, We do not agree with the development of CAP for P8 either. There should not be a performance requirement for an extreme event and hence no CAP needs to be mandated. If the analysis for the extreme events with the clarified Footnote 13 with the single points of failure concludes there is Cascading, the PCs and TPs shall conduct an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences. This is already required today for compliance with the Requirement R2 sub-requirement 4.5 of TPL-001-4. Any development of CAP and its implementation plan for such an extreme event should be at the discretion of the individual entities.	

We agree with the performance requirements for the updated P5 event. However, we do not agree with the 96-months period to meet the performance requirements for the newly identified issues with the proposed P5 events. As the SDT has acknowledged, the only way to meet the performance requirements for P5 events with single points of failure in Protection System will mostly be a capital improvement project to be installed at the identified substation(s). Even though performing the studies/analyses and the development of CAPs are within PCs' and TPs' control, they do not have any control in implementing the CAPs. The amount of capital improvement budget available, the outage coordination amongst various parties (GO, GOP, TO, TOP, system operators and even RCs), project scheduling as well as the availability of manpower to actually implement the CAPs at the substations with a sudden influx of work outside the routine job are numerous facets of the project implementation beyond the control of PCs and TPs. The size of the utility and the number of CAPs to be implemented can create additional different challenges for different types of utilities such as co-ops, municipals, IOUs etc. in different regions/markets (ISO/RTO/vertically integrated etc.) Suggestion: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, We recommend NERC survey the industry (PCs, TPs and Facility owners) with another ***Request for Data Under Section 1600 of the NERC Rules of Procedure*** for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual ***ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP)***.

SCE expects that bullet D in the revised footnote 13 as currently written will bring over half of the existing SCE protection systems into scope for assessment of delayed clearing for P5 events. Without a completed assessment of the impact to reliability, SCE expects that some substations will require Corrective Action Plans to bring protection systems to full redundancy or system reliability within performance requirements. SCE proposes that the implementation plan keep the initial 36 months until Assessments must include the new models and studies but increase the time for developing Corrective Action Plans for P5 and P8 contingencies to an additional 60 months instead of 24. Similar to when TPL-001-4 first became effective, certain categories of contingencies were recognized as needing additional time for Transmission Planning entities to raise the bar on system performance. SCE proposes that the same latitude be applied to TPL-001-5's proposed higher standard of system performance.

The implementation plan requires Oncor to perform contingency analysis for P8 contingencies and develop a Corrective Action Plan for any issues resulting from a P8 contingency. Oncor does not agree with the requirements pertaining to P8 contingencies as outlined in the first comment above. If the P8 contingency is adopted, the implementation time needs to be longer due to the effort required to gather the required information and perform the first analysis.

On page 2 of the implementation plan, there is a statement in the third paragraph which may require some clarification. In "…failures to meet System performance requirements, identified during subsequent Planning Assessment(s), for single points of failure in Protection Systems may not be mitigated by an Operating Procedure during an interim period before a mitigating capital improvement is installed" does the phrase "may not be mitigated" imply that interim Operating Procedures will not be allowed, or is this an acknowledgement (and acceptance) that there may be instances in which an interim Operating Procedure may not be sufficient to meet the System performance requirements? We assume the second interpretation is what was intended, but it is recommended that this statement be clarified to eliminate the possibility of misinterpretation.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2	
Answer	No
Document Name	
Comment	

ERCOT would recommend two further revisions.

First, ERCOT recommends deleting requirement 1.1.2.1. This requirement is circular because one cannot know whether the known outage would result in Non-Consequential Load Loss when it occurs at the same time as a P1 event without performing the study in the first instance. Because this would effectively require one to study each P1 event combined with each known outage anyway, it would be simpler to delete 1.1.2.1 altogether while preserving 1.1.2.2 in order to directly address the relevant directive in FERC Order 786.

ERCOT recommends the following specific revisions based on the foregoing concerns:

1. Delete ", at a minimum:" from section 1.1.2 and replace with the full text of proposed 1.1.2.2 ("does not exclude known outage(s) solely based upon the outage duration.").

2. Delete sections 1.1.2.1 and 1.1.2.2.

Second, ERCOT recommends deleting the proposed additional language in requirements 2.1.3 and 2.4.3. This new language would clarify that the P1 events to be studied are those that are "expected to produce more severe System impacts on [the responsible entity's] portion of the BES." However, this is already permitted under requirement 3.4. This new proposed language is unnecessary and should be deleted.

ERCOT recommends the following specific revisions based on the foregoing concerns:

1. Delete proposed additional language “expected to produce more severe System impacts on its portion of the BES,” from section 2.1.3. 2. Delete proposed additional language “expected to produce more severe System impacts on its portion of the BES,” from section 2.4.3.

The SDT agrees that analyses conducted for Table 1 Planning Events (P3 and P6) result in the same topology as modeling a known planned outage and then simulating P1 events. While the resultant topology may be the same, the performance criteria are different. This comment illustrates that the analysis performed for Near Term Planning Assessments are is often intertwined. The analysis performed for a P3 or P6 event, as well as results of previous planning assessments may be used to inform the planner about the effect of a known planned outages that are coupled P1 events. P5 are single-phase delayed-clearing contingencies. Modeling such contingencies may help in some, but not all scenarios – it is not a replacement for modeling maintenance outages with a single contingency on an adjacent facility.	

Eric Shaw - Eric Shaw On Behalf of: Lee Maurer, Oncor Electric Delivery, 1; - Eric Shaw	
Answer	No

Comment	

Oncor believes that the definition of ‘non-redundant components of protection system’ per Table 1, item 13 is consistent with FERC order 754 (2012) as well as NERC’s technical paper on ‘Redundancy of Protection System Elements’ (2008) – However, this definition coupled with category P5 and newly added category P8 expands much beyond FERC Order 754 for the following reason:

- FERC Order 754 data request limited the buses to be analyzed by the voltage level and number of circuits associated with the bus. These criteria clearly were targeted to pick the more critical stations from reliability and stability stand point.
- The enforceable definition of the non-redundant protection scheme without general guidelines on where to apply such definition, in essence expands the assessment to the entire system without consideration to the criticality of the elements. Generally speaking, it is more common to have non-redundant schemes at smaller stations (lower kV, fewer transmission circuits, remote locations, etc.), as they have minimum system impacts during faults, and tend to have only localized issues (or outages that are not an issue).

Oncor recommends the assessments per category P5 and P8 should be limited to defined critical stations similar to FERC 0rder 754.

The redundancy as per Table 1-13(a) through Table 1-13(c) are reasonable replacement of ‘relay failure’ as per TPL-001-4. However, Oncor is not in agreement with Table 1-13(d) for the following reason:

In Oncor’s experience, failure of DC control circuitry is an unlikely event in general. Additionally, if the circuits were to fail, the result would be a breaker failure (stuck breaker) resulting in operations of breaker failure schemes – avoiding remote delayed clearing which is much longer than breaker failure delay. Oncor believes this requirement is not sufficient justification to require assessing DC control circuitry.

Dislikes 0	

Response
The P8 planning event was removed and made an extreme event. The language in the standard allows the TP/PC to develop a technical rationale in order to determine the Contingencies expected to produce more severe impacts on its portion of the BES. This technical rationale can include critical stations. However, the contingency selection must include generators, transmission circuits, transformers, shunt devices and buses. Understanding the Order 754 only evaluated specific buses and had a brightline criteria. The SAMS and SPCS report was clear to expand the requirements to study more than the facilities included in the SAMS and SPCS report. The SAMS and SPCS recommendations did not recommend a change to this list of faulted elements and the SDT feels that removing generators, transmission circuits, and transformers is not in the best interest of the reliability of the BES. There are many instances where a disturbance followed by a breaker failure results in the exact same study as a disturbance followed by a protection failure. There could be slight differences in clearing times and the TP/PC can choose to run P4 and P5 as one study using the longest clearing time. However, in the event of a bus fault followed by a bus differential protection failure, there is a single relay communicating to several breakers which are the breakers attached to the bus. A bus fault on a breaker and a half scheme or double breaker double bus scheme are particularly problematic. In the P5 event for this type of protection failure, none of the breakers which should open to clear the fault will get the signal from the relay in order and clear the bus fault. This makes the bus differential P5 event significantly more severe than the P4 event. The FERC Order 754 Section 1600 data request was specific to bus faults followed by a single point of failure of the protection system. In cases where a P4 analysis at a specific location will be the same as a P5 analysis. Example: failure of a control circuitry associated with a breaker trip coil results in the same analysis as the P4 for the breaker failing to open in order to clear the fault. Therefore, the P4 and the P5 is the same simulation.

Comment	
We agree with some of the revisions, but believe the establishment of a P8 event is not appropriate, the proposed criteria for including planned outages reaches too far into the Operating Horizon, and that Footnote 13 should be made clearer to avoid varying interpretations.	
Likes 0	
Dislikes 0	
Response	
The SDT agrees and P8 was removed. A three-phase fault followed by a protection failure remains an extreme event. The SDT added clarifying language for footnote 13 to the technical rationale which follows the standard. In IRO-017, there are outages studied in the Time Horizon: Operations Planning, but IRO-017 R4 states that the Planning Assessment for outages must be coordinated with the RC and the Time Horizon: Long-Term Planning. So there is not an overlap since the Time Horizons are different. Also, without a change to TPL-001 for studying outages, there is a gap for IRO-017 R4 requirements.

Comment	
The SPP Standards Review Group suggests restoring the language contained in the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (but without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2). This revision will address the Commission's directive from Order No. 754 and is consistent with the recommendations from the Joint Report regarding the three phase faults.

1. We believe Requirement 2, Part 2.1.3 and Part 2.4.3 should complement our previous recommendation for Requirement 1, Part 1.1.2 on basing significant planned outages according to registered entity-selected facility ratings. The required studies should allow registered entities flexibility on which planned outages are necessary for P1 event studies, particularly those outages that incorporate Facility expansion, construction, or rebuilds and other solutions documented in Corrective Actions Plans.	

2. The reference to open circuit within Footnote 13c needs further clarification. The term "dc supply" is ambiguous and needs to confirm the accepted configuration for substation control houses. Will this require two batteries, two separate battery chargers for a single battery bank, or onsite backup generation as the accepted configuration? The technology currently available for detecting open circuits is problematic and can introduce addition points of failure when in service. We recommend clarifying the reference to read "A single station dc supply associated with protective functions required for Normal Clearing, and that single station dc supply is not monitored or not reported at a Control Center for abnormal DC voltages."

Response	
1. Changes were made to the language related to outages along with revisions to parts 2.1.3 and 2.4.3. The TP/PC needs to have a technical rationale that identifies which outages are "significant". 2. The station DC supply includes station battery, battery chargers and non-battery-based dc supply. This list is included in the NERC Glossary of terms under "*Protection System*". There is a NERC Technical Paper dated November 2008 titled *"Protection System Reliability Redundancy of Protection System Elements*" which explains why monitoring an "open circuit" is required. The SAMS and SPCS recommendation from Order 754 and Section 1600 data request aligns with most of the elements in the NERC Technical Paper. For reference Figure 5-12 is copied from this technical paper.	

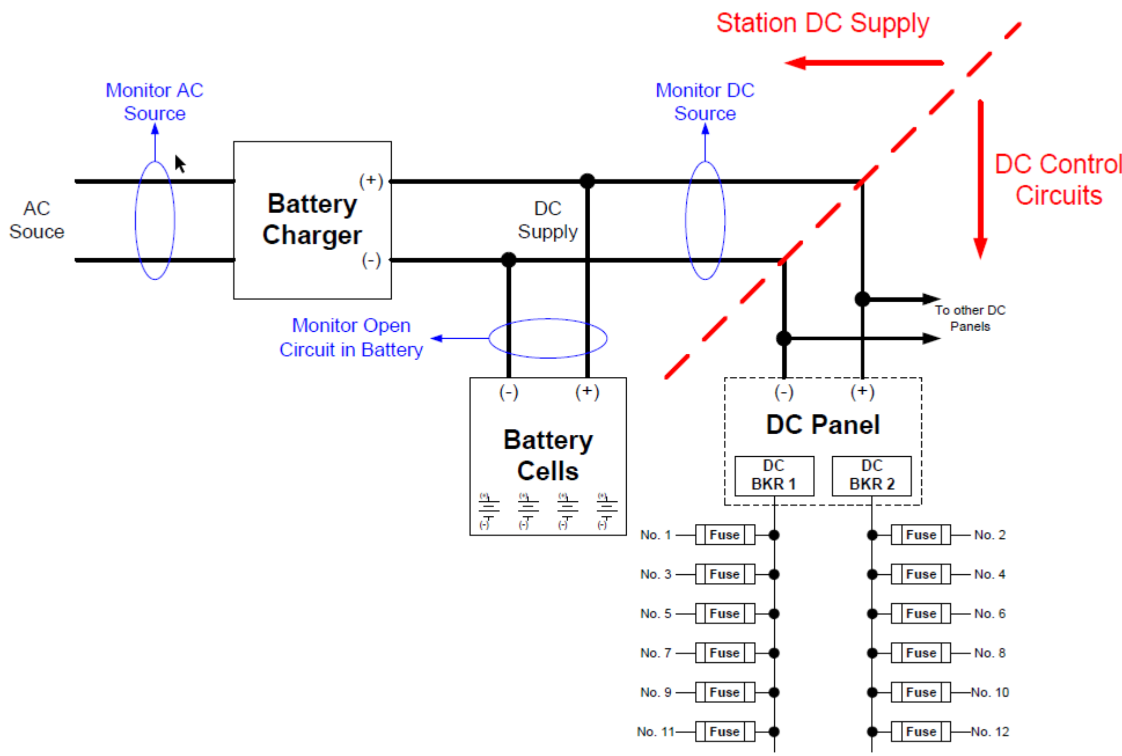

Figure 5–12 — Station DC Supply and Monitoring

For these reasons monitoring of both open circuit and low voltage are required **OR** redundant meaning two batteries, and redundant meaning two battery chargers, etc. The SDT is sympathetic to the fact that open circuit may be problematic and could introduce additional points of failure. However, the FERC directive, SAMS and SPCS Order 754 recommendations and NERC Technical Paper needs to be followed.

Comment	
The California ISO generally agrees with the proposed revisions to TPL-001-4, but would recommend two revisions. First, the California ISO recommends deleting requirement 1.1.2.1. This requirement is circular because one cannot know whether the known outage would result in Non-Consequential Load Loss when it occurs at the same time as a P1 event without performing the study in the first instance. Because this would effectively require one to study each P1 event combined with each known outage anyway, it would be simpler to delete 1.1.2.1 altogether while preserving 1.1.2.2 in order to directly address the relevant directive in FERC Order 786. The California ISO recommends the following specific revisions based on the foregoing concerns: 1. Delete ", at a minimum:" from section 1.1.2 and replace with the full text of proposed 1.1.2.2 ("does not exclude known outage(s) solely based upon the outage duration."). 2. Delete sections 1.1.2.1 and 1.1.2.2. Second, the California ISO recommends deleting the proposed additional language in requirements 2.1.3 and 2.4.3. This new language would clarify that the P1 events to be studied are those that are "expected to produce more severe System impacts on [the responsible entity's] portion of the BES." However, this is already permitted under requirement 3.4. This new proposed language is unnecessary and should be deleted. The California ISO recommends the following specific revisions based on the foregoing concerns: 1. Delete proposed additional language "expected to produce more severe System impacts on its portion of the BES," from section 2.1.3. 2. Delete proposed additional language "expected to produce more severe System impacts on its portion of the BES," from section 2.4.3.

Response	
The SDT removed the circular issue be removing the requirement to model "known outages" in R1 and added language to study known outages in Requirement R2, Parts 2.1.3 and 2.4.3. Other revisions to these sections should satisfy California ISO. The SDT hopes the added language to Parts 2.1.3 and 2.4.3 addresses the California ISO concern on the language "expected to produce more severe System impacts on its portion of the BES".

SCE's key disagreement with the proposed revisions is the language of bullet D of Footnote 13. SCE provided comments on bullet D during draft 1 regarding a monitoring provision like that contained in bullets B & C. The drafting team provided feedback as to its decision at that time due to limitations of PRC-005 monitoring. For draft 2, SCE responded to the direct feedback with additional substantive information for consideration regarding the role PRC-005 monitoring that allows extended maintenance intervals because the equipment will indicate if there is an issue. However, the drafting team didn't provide a rationale for the continued rejection of SCE's proposal to exclude control circuitry through the trip coils that are monitored and reported. Respectfully, SCE wishes to reiterate the reliability value in monitoring control circuitry combined with higher periodicity testing requirements for components such as electromechanical lockout relays required by PRC-005.

Response	
TPL-001-5 footnote 13d was revised to include monitoring of trip coils.	

The SDT understands that monitoring PRC-005 results in extended maintenance periods of some protection systems. The purpose of TPL-001-5 is to give directions to the TP/PC of the elements that must be studied. The SDT does not see a direct correlation between PRC-005 and TPL-001 since a planning standard and a maintenance standard are very different.

Comment	

- The NERC Drafting Team should consider limiting single points of failure at Generation Facilities and develop a criteria for applicability to GOs (Example: Limit GO applicability to relays associated to interconnection points and not all relays that are part of PRC-005). It is understood that this Standard does not directly apply to the GO under the Applicability section of this Standard but it appears they could ultimately be required to create Corrective Action Plans (CAPs) by the Transmission Planner or Planning Coordinator for non-redundant components of a Protection System. Also, singular generation units are already accounted for in Planning Assessments so single points of failure at these locations should be exempt from this analysis. Additionally, the SDT should consider only requiring GOs to identify single points of failure to be included in Planning Assessments but not require GOs to develop Corrective Action Plans (CAPs). The proposed revisions as written, when applied to GOs, would provide little reliability benefit but could potentially result in significant cost associated with upgrading Facilities.

- Single protective relays and single control circuitry referenced in footnote 13 are prevalent for equipment at voltages 100kV -229kV and generally do not meet the redundancy requirements in the proposed revisions of this Standard. The SDT should consider making footnote 13 applicable to equipment at 230kV and above.

- Single communication systems referenced in footnote 13 should be clarified by the SDT and state backup communication can use time delay functionality (does not use communication system) if relays can clear normally. The current wording implies that two independent communication paths are required to report issue back to the Control Center. Additionally, the SDT should

consider allowing weekly communication checkbacks that report back to the Control Center as a method to meet the communication requirements in footnote 13. • A single dc supply referenced in footnote 13 would add significant cost with little benefit for dc supply open circuit monitoring in real-time. The SDT should consider addressing dc supply open circuit during quarterly battery maintenance in PRC-005-6 to reduce cost impact to industry. The estimated total cost for installing dc supply open circuit monitoring would be roughly $50,000 per location.

Response	
The SAMS and SPCS report as a result of Order 754 identified a risk to the BES for both GO and TO facilities and did not recommend a change to the list of faulted elements. Therefore, limiting the single point of failure to generation facilities is not in the best interest of the reliability of the BES. The SDT discussed at length adding either GO and/or TO as applicable entities to ensure that CAP are actually implemented. It was determined that the SAR for this SDT does not allow this change. Limiting TPL-001-5 to EHV only will not eliminate the risk to the BES identified in the SAMS and SPCS Order No. 754. The SDT cannot add a timeframe for reporting communication failures to the control center since this adds a requirement to the TO or GO. The SDT does not believe they have the authority to add TO or GO as an applicable entity. The SDT understands that implementing either monitoring or adding redundancy to DC supplies can be problematic. However, the first step is to determine in the Planning Assessment if there is a risk to the BES as a result of a single line to ground fault followed by loss of the DC supply. If there is a risk to the BES, it does not seem like this added cost to implement redundancy is high compared to the risk.

Thank you for your comments. The addition of the Table 1 P8 Planning Event has been removed from the proposed TPL-001-5. According to the FERC Order No. 786, there is no direct correlation between the time duration of an outage and system impact. A shorter duration outage may be more impactful to the system than a three-month outage. The range of industry comments reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these known maintenance outages. A three-	

month outage duration would ignore the basic differences in network topology, load level, and load shape of each region and entity. Outage duration can be one of the criteria, but not the only criterion. Examples of other factors to be considered are enumerated in Requirement R2, Part 2.1.3 and 2.4.3.

We disagree with the proposed revision to TPL-001-4. Particularly, the inclusion of the new planning event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 sub-requirement 4.5 for extreme events and Cascading (keep this section unchanged from the current TPL-001-4 standard).

The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate.

The inclusion of measures (M) for each Requirement is appropriate.

The clarifications added for the planned maintenance outages of significant facilities from future planning assessments are appropriate and seem to adequately addresses the Commission’s directive from Order No. 786 Paragraph 40.

The clarifications added for entity’s spare equipment strategy for the unavailability of long lead time items are appropriate and seem to adequately addresses the Commission’s directive from Order No. 786 Paragraph 89.

The replacement of the ‘Special Protection Systems’ with ‘Remedial Action Schemes’ is appropriate.

Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure in Protection System (for single phase faults) as well as the recommendations from the joint report from SPCS and SAMS.

The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13. Suggestion: Restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This should adequately address the Commission's concern (for three phase faults) from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

Comment	
While there are many improvements implemented in this posting, there are still some modifications that should be made as articulated in the responses to the previous questions in this Comment Form, and additionally: Requriement 2, Part 1.5, we suggest modifying the following phrase (see BOLD font for modifying word): "…….the impact of this possible unavailability on System performance shall be assessed. The **analysis** shall be performed for the P0, P1, and P2 categories identified in Table 1….." to"…….the impact of this possible unavailability on System performance shall be assessed. The **assessment** shall be based on analysis performed for the P0, P1, and P2 categories identified in Table 1…..".	

Part 2.1.3 and 2.4.3 - We propose alternative text for Part 2.1.3 and 2.4.3, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with the **selected** outages modeled in Requirement R1, Part 1.1.2, under those System peak, Off-Peak, **or other** conditions when **the selected** outages are scheduled **or planned to occur**." The System peak or Off-Peak models will normally be suitable for the Part 2.1.3 requirement. However, explicitly requiring the assessment obligation to be based on only these models excludes the option of using of other models that can represent the applicable system conditions more appropriately than the System peak or Off-Peak models. The addition of the word, "planned", allows the inclusion of outages identified by PCs or TPs that are necessary in the planning horizon to implement Corrective Actions Plans – as most if not all are likely not to be scheduled yet. Item h in the first page of Table 1 should be relocated to "after Item e" but before the Steady State section. Then re-alphabetize accordingly. Footnote 14 - We propose adding a **Footnote 14** that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, "Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES. Subsequent, corresponding SLG fault contingencies may be performed, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss or Cascading. " Even with the relaxation of required performance, the rationale to include 3 phase faults with the failure a non redundant component of a Protection System is too onerous (P8).

Comment	

In addition to the issues noted in #2, Texas RE noticed the following:

- In Part 3.4, Texas RE is concerned that allowing registered entities to select which P1 events are "expected to produce more severe System impacts", registered entities have the flexibility to ignore P1 events without determining the actual impact of the events. Texas RE recommends all P1 events should be selected.
- In Table 1, Texas RE noticed P8 is not listed in Steady State Only or Stability Only. Is it the SDT's intent to leave it out of those conditions?

Likes 0	
Dislikes 0	

Response

The language in TPL-001-4 contains the following language for all P1 through P7 and extreme events "…. events in Table 1, that are expected to produce more severe System impacts …". While your statement is true, an entity could ignore some P1 events that are more severe or most severe, changing the standard to require all P1 events will be arduous for some entities. Additionally, this changes was not included in the SAR and the SDT may not have the authority to make this change at this time. Each entity in their selection of the P1 contingencies must have a technical rationale for identifying the P1 contingencies they select. As an RE, you can make recommendations that they revise their technical rationale to include something they are not including at present.

It was the intent of the SDT to require stability to be performed on P8 events. Due to other comments P8 was removed as a planning event and kept as an extreme event.

KCP&L recommends the Standard include language that will allow establishing the scope of contingencies in dynamics to a specific area local to the equipment.

Concern

The proposed revisions substantially expand required assessments and studies, including long-lead time equipment into dynamic analysis, and consideration of all outages—without limitation—during the assessment process.

The company recognizes the proposed revisions reflect the Orders' language requiring consideration of outages without limitation, and so forth, but the language to satisfy the Orders require markedly greater resources.

Recommendation

KCP&L suggests adding language that provides an efficiency, or like efficiencies, in the assessment process and addresses the Standard Requirements. We suggest the following:

Requirement language or guidance that establishes the scope of contingencies in dynamics to a specific area local to the equipment. This provides an efficiency in the evaluation of contingencies by allowing the TP to draw a bus-ring around applicable equipment and evaluate contingencies within a smaller, yet relevant, range.

Likes 0	
Dislikes 0	
Response	

The SDT does not have authorization in the SAR to limit the scope of dynamic simulations. The TP/PC can utilize a contingency selection criteria in the technical rationale. The list of stability analysis contingencies can include only those Contingencies where if lost results in more severe impacts to the BES. This language exists in TPL-001-4 and is not being revised by the SDT of TPL-001-5. The FERC directive from Order No. 786 requested "significant" outages be studied with a duration time less than six months. The SDT has difficulty defining "Significant Outages" that work for all entities from the east coast to the west coast. The language "Known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure, or according to a technical rationale …" allows the TP/PC to have a documented procedure or technical rationale which is designed to reduce the list of outages required to be studied. It is up to the TP/PC to determine what "Significant Outages" mean for their system. The language was not intended for the TP/PC to study all outages. For KCP&L, their technical rationale can state "specific areas local to the equipment" that are more critical to KCP&L's portion of the BES. Long Lead Equipment: TPL-001-4 requires steady state studies be performed for items Long Lead Transmission equipment that do not have spares. Adding spare equipment can reduce the need for performing stability studies for these types of equipment. FERC Order No. 786 directed the SDT to add language requiring Long – Lead Equipment without a spare be studied in stability not just steady state. Therefore, the SDT is required to make this revision to the standard.

Comment	
National Grid would like to express our appreciation and supports the direction in which the TPL-001-5 SDT is proposing to adjust the NERC Reliability Standard TPL-001, including the creation of the proposed P8 event. We believe that, in particular, Footnote 13 still includes some ambiguity in defining what protection performance is needed to reduce the risk of reliability impact from Single Points of Failures, and would like to provide the following comments:	

Does “spare equipment strategy” mean the existence of at least a single spare for major transmission equipment that has a lead time of more than one year; and does Requirement 2.4.5 imply that the existence of such a spare would eliminate the need to assess the impact of the possible unavailability of such equipment on System performance? If so, then Requirement 2.4.5 should be written this way.

As currently written, Requirement 2.4.5 lacks clarity. Every reasonable “spare equipment strategy” for equipment with a lead time of one year or more could result in the unavailability of such equipment; it is a matter of probability. For example, an Entity with 100 large power transformers could have a spare transformer strategy of maintaining one system spare. However, it is possible that two transformers could fail during time span of one year. With only one spare, the Entity would be exposed to operating the system for up to one year with one less transformer than designed. Even if the Entity has four (4) spares, it is still possible that five (5) transformers could fail during one year (albeit with much lower probability), which would leave the Entity similarly exposed. Greater clarity is required for Requirement 2.4.5, as is more criterion development.

It is not fully clear as to what constitutes “comparable” in the context of comparable Normal Clearing times in Table 1 Footnote 13 Part a. Please also clarify what constitutes an "alternative" relay, beyond allowing for response to non-electrical quantities. What if alternative relay does not provide the same clearing time as the primary relay (e.g., the alternate relay is an impedance relay with longer Zone 2 timer, or the alternative relay is an overcurrent relay, while the primary relay is an impedance relay). Could any relay classified as an “alternative” relay be considered as ‘redundant’, and therefore Footnote 13 would not apply? We would like the SDT to provide guidance on what constitutes “comparable” Normal Clearing times and an “alternative” relay, e.g., in a ‘Guidelines and Technical Basis’ section.

Even after including auxiliary relays and lockout relays, it is still not fully clear what the term “control circuitry” includes. As written, it seems that “control circuitry” (apart from wiring) includes auxiliary relays and lockout relays. Since we believe it could be advantageous to provide a more ‘formal’ definition of this term, we suggest providing additional guidance in a ‘Guidelines and Technical Basis’ section and/or including a definition for “control circuitry” in the ‘Glossary of Terms Used in NERC Reliability Standards’.

As another Entity brought up during the NERC webinar on March 22, 2018, why does the exclusion (provided per Footnote 13 Part b) for communication systems not also extend to single protective relays (referred to in Footnote 13 item a), if monitored or reported at a Control Center?

We also believe it would be of value to consider requesting entities to document the rationale regarding considerations regarding non-redundant components of a Protection System evaluated per Footnote 13.

Dislikes 0	

Response

The spare equipment language in Requirement R2, Part 2.4 mirrors the language in the TPL-001-4 2.1.5. The SDT does not desire to revise the existing language in Requirement R2, Part 2.1.5. However, clarity on what is meant by the spare equipment strategy is being added to the technical rationale.

The SDT affirms that all parts of footnote 13 has to be either redundant, or monitored (footnote 13 b, c, and d) or studied as a P5 event. The technical rationale is used to develop a contingency list of BES facilities that if lost have a more severe impact to the BES. Once the list of BES facilities are identified all parts of footnote 13 must be evaluated as a P5 event.

The footnote 13 focuses on the components of a Protection System to be considered as having a reliability impact from Single Points of Failures.

Footnote 13a is the only part of the footnote that does not have monitoring. TPL-001-4 P5 is for non-redundant relays. If monitoring were added to footnote 13a, it lowers the bar from where TPL-001-4. There is no desire from the SDT to lower the bar.

Related to “comparable” in footnote 13a, in the context of comparable Normal Clearing, and ‘’alternative’’ relay terms, additional clarity was added to the technical rationale.

The relay classified as an “alternative” relay can be considered ‘’redundant’’, if it is designed with the same performances as the protective relay such as the operating time, selectivity (tripping of the same elements).

If not, the alternative relay, which responds in a delayed clearing time and trips more elements than the protective relay, cannot be considered redundant. Then the P5 event will need to be studied using the delayed clearing time. Any elements expected to be tripped by the alternative relay must be tripped during the P5 simulation.

DC control circuitry includes everything from where the DC supply ends up to and including the trip coils. This includes the wires, auxiliary relays and lockout relays. We agree with the suggestion that additional clarity should be added to the technical rationale.

According to the NERC State of Reliability 2014 report, the top causes of failure are: incorrect setting, logic, or design error, relay failures/malfunctions. Relays have higher rate of failure compared to station dc supply and communication system. Therefore, the protection system design must consider the protective relays exposure to higher risk of failure.

It is recommended to consider revising Sections 3.2 and 3.5 in a similar manner to the proposed revisions to Sections 4.2 and 4.5. *Additional Comment for consideration, related to Requirement #4 (related to clarification of the Standard):* Requirement 4.1 states that "Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1….." Immediately after 4.1, sub-requirements 4.1.1 through 4.1.3 specify specific system/generator stability performance requirements which are not mentioned in Table 1. Our observation is that Table 1 includes steady state and stability related performance requirements. This apparent placement of performance requirements in more than one location within the Standard document is confusing. Recommendation for consideration is to move sub-requirements 4.1.1 through 4.1.3 to Table 1. *Additional Comment for consideration, related to clarification of the Standard:* Regarding Table 1, if the performance requirements (steady state / stability) are not being met, AND, if Table 1 indicates that non-consequential load loss and interruption of Firm Transmission Service are allowed, is a specific corrective action plan required as per Requirement 2.7 (assuming that non-consequential load loss and/or interruption of Firm Transmission Service would allow for meeting the performance requirements)? This question relates to a scenario where Footnote 12 does not apply. A general recommendation is to clarify within the standard whether or not a specific corrective action plan is required to be documented, as per Requirement 2.7, in the Planning Assessment for this scenario (i.e. performance requirements are not being met and Footnote 12 does not apply).

Revisions to Requirement R3, Parts 3.2 and 3.5: This is a good suggestion the standard was revised with this change. Revisions to Requirement R4, Part 4.1.1 through 4.1.3: This is also a good suggestion. However, the issue is contained in TPL-001-4. The SDT also feels that adding additional columns to Table 1 will make it very difficult to see on standard printable paper. Related to Requirement R2, Part 2.7: If Table 1 does NOT allow non-consequential load loss and/or interruption of Firm Transmission Service and footnote 12 does not apply, a TP/PC can utilize Part 2.7.3 until a CAP can be implemented. If the non-consequential load loss or interruption of Firm Transmission Service can be done in order to meet the performance requirements and it is allowed in Table 1, then the CAP is required but it could be an operating procedure which identifies the load to drop or transmission service to curtail in order to meet the performance requirements. The NERC Glossary for a CAP can include operations instructions or specific construction of projects.

GRE agrees with the MRO NSRF and ACES comments and: **13b. Single communications system** • Monitoring a single communication scheme does not provide the same robustness as having a redundant communication scheme. • Communication failures in blocking schemes do not result in delayed clearing. •	

- It is important for planning to identify locations where delayed clearing of faults (such as in zone 2 time) could lead to cascading outages or stability concerns. If faster clearing times are required, these elements should have redundant communications installed. In many companies, these studies are already being performed. If not, the requirement to study the impact of failures of single communication schemes could drive a company to identify where redundant communications are required.

-

- The intent of the standard is to study failures/contingencies which are most impactful to the BES. Typically, single communication schemes are in place to limit damage, improve coordination and as a good design practice. If a communication scheme is installed for these reasons, the “Normal clearing time” of the protective system may not be necessary to maintain system stability or prevent cascading outages.

-

- The use of the phrase “Normal Clearing time” should be changed to “time required to maintain system stability” or “critical clearing time” or “time to prevent misoperation, cascading, or unintentional islanding”. Otherwise, non-redundant communications systems which were not installed for the purpose of maintaining stability would need to be evaluated (or monitored). Such evaluation would be an unnecessary burden.

13c. Single station dc supply

- How common is the monitoring of a battery open circuit condition? FERC Order 754 report says it was not common at the time of the order to have redundant batteries, and it is probably not that common now to have redundant batteries or open circuit monitoring. Without open circuit monitoring, it is possible that a charger might mask an open circuit in the battery. Open circuit monitoring is possible but is not universally applied where there are single batteries.

- FERC Order 754 only applied to 200 kV substations or higher. The number of substations lower than 200 kV without redundant batteries will be substantially higher.

- GRE’s standard design for new 230 kV substations or higher is to install redundant batteries, but we have many existing facilities that have one battery bank with redundant AC supply. Monitoring for open DC supply has not been considered in the past when defining a redundant DC supply.

- Periodic open circuit testing as required by PRC-005 will likely not meet the requirement of open circuit monitoring.

- This requirement seems likely to drive industry to either retrofit existing installations with open circuit monitoring or to install redundant DC supplies. Is this the appropriate place to drive that decision, for a high impact/low risk battery failure? This could be a significant impact, and it appears that this impact may not be fully understood in the context of reviewing this standard.

- Should a risk based approach be considered—an open circuit battery failure is a low risk, high impact event?

13d. Single control circuitry

- As written, this seems to apply to components (coils, auxiliary relays) and wires.

- Verifying where there is single control circuitry could be costly—there are many legacy installations which may not follow present design practices and would require some type of manual review of substation drawings.

- Consider audit evidence for this requirement. Documentation of present design standards which meet the requirement is practical, will it be sufficient?

- A risk based approach to this requirement which limits the review to redundancy of components instead of wires may be practical. The failure rate of wiring is far less than that of components.

Response

Footnote 13b: The SDT agrees that monitoring does not provide the same robustness as redundancy. However, the SDT is going above the exact recommendation of the SAMS and SPCS report when communications were added to footnote 13. So monitoring was also added since monitoring is allowed for footnote 13 c and d.

The SDT agrees that not all communication failures result in delayed clearing and therefore these would not need to be studied.

The TP/PC is allowed to identify a critical clearing time and that can be given to the protection engineer to ensure that all parts of footnote 13 are meeting at least this critical clearing time. However, the SDT does not want to be so prescriptive in identifying exactly how the TP/PC should run the P5 analyses.

Footnote 13c: Based on comments from industry monitoring of open circuit is not common and can be problematic, but the SDT does not desire to change the requirement. Redundancy of batteries and chargers is a second option if the performance requirements are not met, adding redundancy being the primary option. A NERC Technical Paper dated November 2008 titled *"Protection System Reliability Redundancy of Protection System Elements*". This document explains why monitoring an "open circuit" is required. The following diagram was taken from the referenced document.

Per the FERC Order No. 754 and SAMS/SPCS report from the Section 1600 data request, the SDT believes that the changes to this standard IS the appropriate place FERC has decided to drive the requirement to retrofit existing installations with open circuit monitoring or install redundant DC supplies, in spite of the low probability of failure.

The SDT understands that GREs substations below 200 kV may be impacted by the changes to this standard. However, there is also a lower probability that there exists performance requirement violations at these lower voltage classes.

The SDT does not feel they have the authority to address PRC-005 requirements.

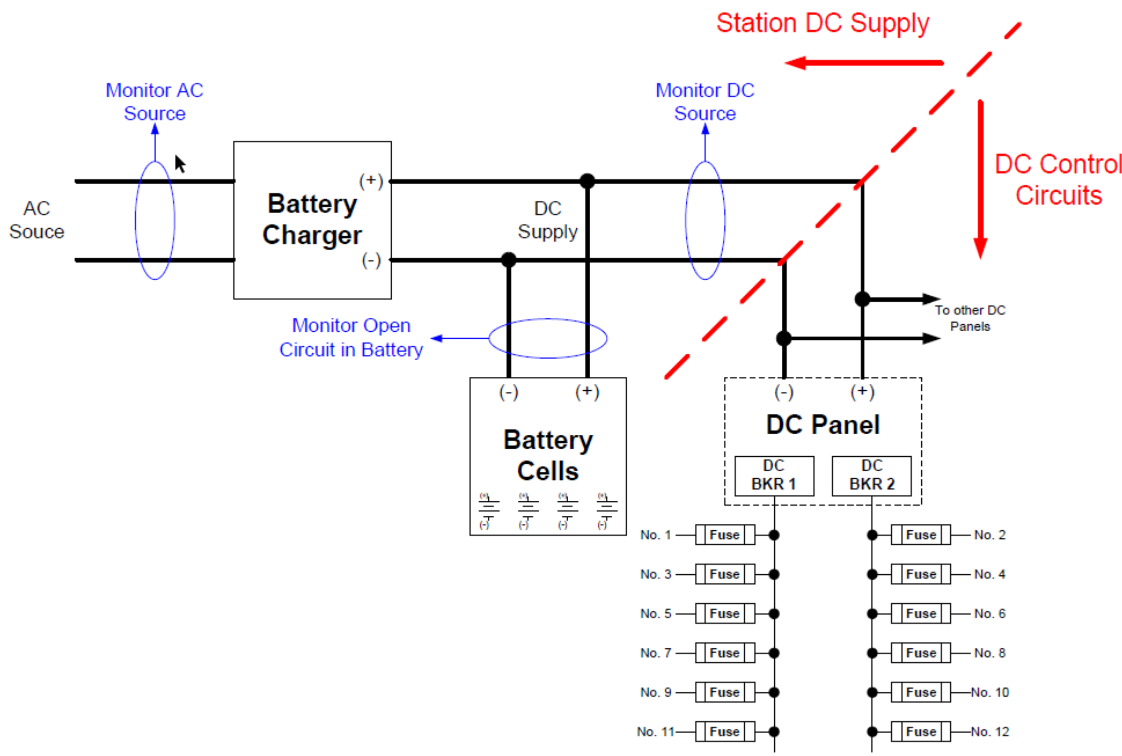

Figure 5–12 — Station DC Supply and Monitoring

The protection experts that the SDT consulted with state that monitoring for "open circuit" can be done without adding to the probability of failure.

Footnote 13d.

- It is correct, the DC control circuitry includes trip coils, auxiliary relays and wires. Footnote 13d applies to everything piece of equipment where the DC supply stops up to and including the trip coils.

- The protection group should be able to identify whether there are single control circuitry.

• For evidence a written notification from the Protection Engineer to the Planning Engineer of which portions of the protection system are or are not redundant. The Planning Engineer via the “technical rationale” can determine what facilities if lost would result in more severe impacts to the BES. The SDT suggests listing the four components of footnote 13 for every location identified by the technical rationale, then the Protection Engineer must look at the protection system at each of these Facilities and identify which have redundancy and give this information back to the Planning Engineer along with the clearing times required to perform the appropriate studies. If redundancy does not exist, then the Planning Engineer needs to perform the studies and determine where redundancy must be added or identify other forms of CAPs. • Monitoring was added to footnote 13d which is intended to make the requirements easier to comply with.

Requirement R2, Parts 2.1.3 and 2.4.3: The language of these two parts were significantly revised.

Footnote 13b
While most people may agree with this comment that monitoring of communications is not sufficient, the SDT went above and beyond the SAMS and SPCS recommendations when they added communication-aided protection scheme to footnote 13. The SDT intentionally did not include interval and reporting since it looked like this would add "Transmission Owner" as a functional entity to the standard. Since the TP and PC do not have direct control over monitoring intervals and reporting times it was felt that evidence of intervals and reporting could not be easily obtained by a PC/TP.

Footnote 13c
The technical rationale which accompanies the standard will include wording that the single DC supply includes batteries and chargers. The SDT intentionally did not include interval and reporting since it looked like this would require "Transmission Owner" be a functional entity to the standard. Since the TP and PC do not have direct control over monitoring intervals and reporting times it was felt that evidence of intervals and reporting could not be easily obtained by a PC/TP and put responsibility of monitoring on the incorrect entity.

Footnote 13d
While a risk based approach which may eliminate the wires is a good suggestion, the control circuitry includes trip coils, auxiliary relays and wires. Footnote 13 d applies to every piece of equipment where the DC supply stops up to and including the trip coils. In order to make DC Control Circuitry, monitoring of DC control circuitry was added to footnote 13d.

Footnote 14: The P8 planning event was removed and a three-phase fault was made an extreme event, so we believe this comment no longer applies.

Footnote 13, item c lacks clarity as to what constitutes a single station d.c. supply. Typical stations are configured with two components that operate as a single d.c. supply system – an inverter and battery bank. Each of these components provide some redundancy to provide d.c. load for failure of the other component, which could be interpreted as meeting the requirements for a redundant system with no further monitoring required per Proposed Reliability Standard TPL-001-5 Table 1. However, if the entire d.c. supply system is considered a single component, then the requirement to monitor for open circuit is not sufficiently clear to determine if the inverter, battery, or load must be monitored for open circuit. PPL NERC Registered Affiliates requests clarification to Proposed Reliability Standard TPL-001-5 Footnote 13, item c – specifically, as to what constitutes a single station d.c. supply to eliminate ambiguity of the requirement to monitor for open circuit needs.

Response

The SDT does not want to list all the elements included in the "single station dc supply". As a minimum it includes the station battery, battery charger and non-battery-based dc supply as defined in the NERC Glossary under "Protection System". A battery charger may not have enough power to open several breakers for a bus differential and causing a protection system not to function if the battery itself fails. The diagram below from NERC Technical Paper dated November 2008 titled *"Protection System Reliability Redundancy of Protection System Elements*" shows how monitoring for both open circuit and low voltage should be done.

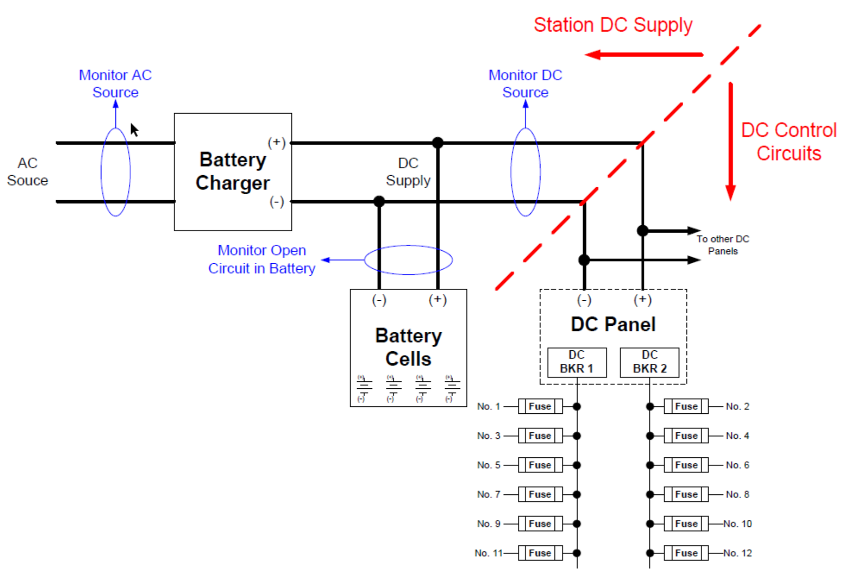

Figure 5–12 — Station DC Supply and Monitoring

Part 2.1.3 - We suggest adjustments to Part 2.1.3 that coordinate with our Question 2 comments, “P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned.”

We propose that the standard include wording that will allow the option of studying any known outages under the conditions that they are planned to occur when those conditions are more appropriate than System peak or Off-Peak conditions.

Part 2.4.3 - We propose adjustments to Part 2.4.3 that coordinate with our Question 2 comments, “P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned”.

Same explanatory text as Part 2.1.3.

Table 13, Footnote 13

For 13.b, the monitoring and reporting exception is not consistent with the 13.a requirements for protective relay redundancy, even though communication system components can be very similar in design and performance. The interval of monitoring and reporting is not defined. The ability to monitor the status of a communication system component does not fully mitigate the risk of the failure of a non-redundant component and should be treated like protection components identified in 13.a.

For 13.c, Wording should be added to clearly state that the combination of a dc charger and a dc battery is part of a single dc supply to avoid inconsistent interpretation of a single dc supply. The interval of monitoring and reporting is not defined. The PRC-005 standard requires that “Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.” Some battery open circuit monitors, that are presently available, have monitor intervals that only occur every few months, which are significantly longer than the PRC-005 maintenance requirement. The normally long open circuit monitoring intervals is expected to make the open circuit monitoring exception irrelevant.

For 13.d, the wording of “single control circuitry” is non-specific and may lead to inconsistent interpretation. The SDT should use a risk-based approach for identifying applicable circuitry that recognizes that wiring has a much lower risk of failure than the other Footnote 13

components. A risk-based approach would allow the industry to appropriately prioritize resources to meet the objectives of the standard and insure Bulk Electric System reliability. **Footnote 14** - We propose adding a Footnote 14 that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, "Transmission Planners (TPs) and Planning Coordinators (PCs) can perform the 3-phase fault simulations first for contingencies that are expected to produce more severe System impacts on its portion of the BES, than the corresponding SLG fault contingency. Subsequent, corresponding SLG fault contingencies may be performed, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. Requirement R2, Part 2.1.3 and 2.4.3: The language of these two parts were significantly revised. **Footnote 13b** While most people may agree with this comment that monitoring of communications is not sufficient, the SDT went above and beyond the SAMS and SPCS recommendations when they added communication-aided protection scheme to footnote 13. The SDT intentionally did not include interval and reporting since it looked like this would add "Transmission Owner" as a functional entity to the standard. Since the TP and PC do not have direct control over monitoring intervals and reporting times it was felt that evidence of intervals and reporting could not be easily obtained by a PC/TP. In case of single points of failure in the communication system associated with the protective functions causing their failure to operate, the system performances can be preserved by an adequate design that involves the communication system and the backup protection. However, single points of failure of a protective relay will result in delayed fault clearing. Moreover, the failure may remain undetected until the relay is tested, depending on the relay type (electromechanical relay, microprocessor relay) and protection system design. According to the NERC State of Reliability 2014 report, the top causes of failure are: incorrect setting, logic, or design error, relay failures/malfunctions. Relays have higher rate of failure compared to station dc supply and communication system. **Footnote 13c**	

The technical rationale which accompanies the standard will include wording that the single DC supply includes batteries and chargers. The SDT intentionally did not include interval and reporting since it looked like this would require "Transmission Owner" be a functional entity to the standard. Since the TP and PC do not have direct control over monitoring intervals and reporting times it was felt that evidence of intervals and reporting could not be easily obtained by a PC/TP and put responsibility of monitoring on the incorrect entity.

Footnote 13d

While a risk based approach which may eliminate the wires is a good suggestion, the control circuitry includes trip coils, auxiliary relays and wires. Footnote 13d applies to every piece of equipment where the DC supply stops up to and including the trip coils. In order to make DC Control Circuitry, monitoring of DC control circuitry was added to footnote 13d.

Comment

In addition to the comments written above in answer to Questions 1 and 2, FMPA notes that the questions in this comment form do not cover all of the changes. Order 786 required more than just the changes to Requirement 1, part 1.1.2. There is also the addition of Requirement 2.4.5, adding stability analysis as required per an entity's Spare Equipment Strategy. FMPA notes that while studying these events in steady state using P0, P1 and P2 events, doing so for stability doesn't quite make sense. FMPA would support an alternative that simply stipulates that the PA/TP should study which ever Planning event it feels would be the most prudent based on the specific facility(ies) that could be out of service. Many entities do not run P1 events in stability – rather, they simulate other Planning events that, in their engineering judgment, produce more severe system impacts. Thus it doesn't make sense to add P1 events just because a major

facility could be out of service – this may not change the fact that another event such as a P4 or P5 may still be more important to study due to clearing times, and it doesn't really save the entity any time.

Thank you for your comment. The SDT believes the language in the FERC Order No. 786 was clear and the requirement to have stability analysis performed for P1 and P2 was part of the FERC Order. The P3-P7 planning events have a lower probability of occurrence and this is likely the reason that they were not included in FERC Order No. 786.

NVE proposes the following changes for various requirements listed below: **Table 1, Footnote 13d** NVE recognizes the importance of studying the impact of a failure of a single control circuitry, but has concerns with the duplication of component types in this footnote with other planning events. Studying the failure of control circuitry associated with a breaker trip coil would result in a breaker failing to operate for a fault. This is the same effect as a fault plus a stuck breaker. NVE recommends that Footnote 13d be modified to include studying the failure of auxiliary relays and lockout relays. Footnote 10 should be modified to include scenarios of a failure of a single breaker trip coil to operate. **Table 1, Footnote 13c** Wording to this footnote should be changed to match the portion of the definition of Protection System associated with dc supply to ensure that the failure of any component of a dc supply is studied. *A single station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery based dc supply) required for Normal Clearing….* **R4.2 and R4.5** NVE agrees with the proposed changes to R4.2 and R4.5. Given that the wording and intent of R3.2 and R3.5 is the same as R4.2 anD R4.5, but for different portions of the planning study (steady state vs dynamic), NVE recommends that R3.2 and R3.5 be modified to match R4.2 ans R4.5 to maintain consistency.

Response
Table 1, Footnote 13d The TP/PC needs to perform studies and then develop CAPs. The SDT agrees that many parts of P5 footnote 13 and with P4 events results in the same study and therefore the same results. However, if the performance requirements are not met, the CAP needs to cover the P4

stuck breaker issue, and any of the P5 things that are not redundant and/or monitored. Therefore the study of a single planning event may be the same for P4 and many parts of a P5 and it only has to be studied once. However, if this study identifies performance requirement violations, the CAP can be very different. An example of a CAP could be: add stuck breaker scheme to the protection system, add a redundant relay, add redundant control circuitry, add monitoring of DC power supply for both open circuit and low voltage, add monitoring of communication-aided protection scheme. All these things could be required to mitigate the issue identified in the single simulation of the planning assessment. A CAP which eliminates just the stuck breaker issue is not good enough. All components of the protection system listed in footnote 13 have to be included in the CAP along with a method of mitigating the stuck breaker performance violation when a P4 has the same clearing time as the P5. All components of the protection system as well as breakers have to be listed in the standard so as not to eliminate portions of the CAP that would be required in the event that a performance requirement violation shows up in the planning assessment. The P4 and P5 components are not listed to identify both what needs to be studied is also intended to ensure that the CAP includes all the necessary items to improve the reliability of the BES.

The SDT is not attempting to list all things which are included in Footnote 13d since there is likely equipment that exists somewhere that will not be on the list. Footnote 13d includes all things between where the DC supply ends up to and including the trip coils, which includes auxiliary and lockout relays, wires everything from a specific point to another specific point.

Footnote 13c:
This is a very good comment and was considered. Since the SDT cannot come up with an exhaustive list that incorporates all things that can exist in the electric grid from the east coast to the west coast, additional language was added to the technical rationale which follows the standard and should be referred when an entity is unclear what is meant by “Single Station DC supply”.

Requirement R4, Parts 4.2 and 4.5:
The SDT agrees with this comment and made the change to the standard.

OG&E recommends that Table 1, Footnote 13(d) should be revised to allow exceptions for trip coil circuit monitoring as follows: "d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing**, which is not monitored or not reported at a Control Center**. OG&E suggests restoring the language contained in the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (but without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the Commission's directive from Order No. 754, and is consistent with the recommendations from the Joint Report regarding three phase faults.

Part 2.1.3 - We suggest adjustments to Part 2.1.3 that coordinate with our Question 2 comments, "P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned." We propose that the standard include wording that will allow the option of studying any known outages under the conditions that they are planned to occur when those conditions are more appropriate than System peak or Off-Peak conditions.	

Part 2.4.3 - We propose adjustments to Part 2.4.3 that coordinate with our Question 2 comments, “P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under System peak or Off-Peak or other conditions when known outages are planned”.

Same explanatory text as Part 2.1.3.

Table 13, Footnote 13

For 13.b, the monitoring and reporting exception is not consistent with the 13.a requirements for protective relay redundancy, even though communication system components can be very similar in design and performance. The interval of monitoring and reporting is not defined.

For 13.c, Wording should be added to clearly state that the combination of a dc charger and a dc battery is part of a single dc supply to avoid inconsistent interpretation of a single dc supply. The interval of monitoring and reporting is not defined. The PRC-005 standard requires that “Alarms are reported within 24 hours of detection to a location where corrective action can be initiated.” Some battery open circuit monitors, that are presently available, have monitor intervals that only occur every few months, which are significantly longer than the PRC-005 maintenance requirement.

For 13.d, the wording of “single control circuitry” is non-specific and may lead to inconsistent interpretation. The SDT should use a risk-based approach for identifying applicable circuitry that recognizes that wiring has a much lower risk of failure than the other Footnote 13 components. A risk-based approach would allow the industry to appropriately prioritize resources to meet the objectives of the standard and insure Bulk Electric System reliability.

Footnote 14 - We propose adding a Footnote 14 that is noted in the Fault Type field of P5 and P8. The footnote would have wording like, “Transmission Planners (TPs) and Planning Coordinators contingency. Subsequent, corresponding SLG fault contingencies may be performed, if the BES level is EHV and the 3-phase simulation resulted in the interruption of Firm Transmission Service or Non-Consequential Load Loss. “

Response

Requirement R2, Parts 2.1.3 and 2.4.3 are significantly revised.

Footnote 13b: TPL-001-4 P5 is applicable to non-redundant relays and does not allow for monitoring. The SDT does not want to reduce the bar from TPL-001-4 by adding monitoring.

Footnote 13c: The technical rationale containes language clarifying what footnote 13c includes. If interval of monitoring were included, the TO would have to be an applicable entity in the standard. This would go aginast the SAR.

Footnote 13d: The technical rationale includes additional language on what is defined as DC control circuitry. While the SDT agrees that wires have a lower risk of failure, wires are part of the DC control circuitry. In the latest version of the red-line version of the standard, monitoring of footnote 13d was added. Hopefully, this change is more palatable.

Footnote 13b

While most people may agree with this comment that monitoring of communications is not sufficient, the SDT went above and beyond the SAMS and SPCS recommendations when they added communication-aided protection scheme to footnote 13. The SDT intentionally did not include interval and reporting since it looked like this would add "Transmission Owner" as a functional entity to the standard. Since the TP and PC do not have direct control over monitoring intervals and reporting times it was felt that evidence of intervals and reporting could not be easily obtained by a PC/TP.

In case of single points of failure in the communication system associated with the protective functions causing their failure to operate, the system performances can be preserved by an adequate design that involves the communication system and the backup protection. However, single points of failure of a protective relay will result in delayed fault clearing. Moreover, the failure may remain undetected until the relay is tested, depending on the relay type (electromechanical relay, microprocessor relay) and protection system design. According to the NERC State of Reliability 2014 report, the top causes of failure are: incorrect setting, logic, or design error, relay failures/malfunctions. Relays have higher rate of failure compared to station dc supply and communication system.

Footnote 13c

The technical rationale which accompanies the standard will include wording that the single DC supply includes batteries and chargers. The SDT intentionally did not include interval and reporting since it looked like this would add "Transmission Owner" as a functional entity to the standard. Since the TP and PC do not have direct control over monitoring intervals and reporting times it was felt that evidence of intervals and reporting could not be easily obtained by a PC/TP.

Footnote 13d
While a risk based approach which may eliminate the wires is a good suggestion, the control circuitry includes trip coils, auxiliary relays and wires. Footnote 13 d applies to everything piece of equipment where the DC supply stops up to and including the trip coils. FERC directive was to implement the SAMS and SPCS recommendations from Order 754 and section 1600 data request. According to the SAMS and SPCS recommendation from Order 754 and Section 1600 data request and NERC Technical Paper dated November 2008 titled *"Protection System Reliability Redundancy of Protection System Elements*", wiring of the DC controls needs to be included as redundant. The SAMS and SPCS recommendation was in the FERC order requesting changes to TPL-001-4.

Footnote 14: In the latest version of the standard, the P8 event was removed and a three-phase fault followed by a protection failure was made an extreme event.

Shawn Abrams - Santee Cooper - 1	
Answer	No
Document Name	
Comment	
Santee Cooper disagrees with the proposed revisions to TPL-001-4. The inclusion of a new planning event that requires a CAP goes against Section 215 of the Federal Power Act which expressly prohibits NERC from promulgating standards which would require utilities to enlarge facilities or construct new transmission or generation.	
Likes 0	
Dislikes 0	
Response	
The SDT is following the FERC orders for the revisions recommended. CAPs can include operating guides which are little or no cost. Without more specifics on this comments, the SDT is not able to respond with any more detail.	

Patricia Robertson - BC Hydro and Power Authority - 1,3,5, Group Name BC Hydro	
Answer	No
Document Name	
Comment	
BC Hydro appreciates the efforts of the SDT in revising TPL-001-5 – Transmission System Planning Performance Requirements. BC Hydro votes "No" and wishes to provide the following comment. ***The proposed amendments scope from Single Point of Failure is very wide, which will apply to the entire bulk electric system i.e. 100 kV and above. Our ballot would have been affirmative if the scope were limited to extra high voltage (360 kV and above), where a single point of protection failure after a fault can trigger a major system disturbance.*** ***Below extra high voltage levels, BC Hydro protection systems are built using principles of good utility protection practices, as described in the ANSI/IEEE standards and guides, to ensure that they have acceptable reliability i.e. clear faults without mis-operating. Our protection systems are largely redundant but still can have a single point of failure, such as where there is a shared breaker trip coil or a single telecom fibre etc. Based on our fifty years of operating experience, there is no known case where a single point of failure in our high voltage protection system precipitated in a major system disturbance event. It is because probability of a single failure (in our redundant high voltage protection system) impacting our system performance is negligible. Yet demonstrating compliance to the proposed amendments will require BC Hydro to redirect our critical resources (financial and people) in identifying single points of failure in our every single high voltage P&C asset, estimate incremental protection clearing time associated with that failure, and then demonstrate acceptable system performance during the event. Instead of redirecting our critical resources to demonstrate compliance to this negligible probability event, BC Hydro will receive higher reliability benefits by continuing to invest our resources in upgrading the aging protection systems.***

Comment	
Although appreciative of the drafting team's work on TPL-001-5, LES believes the following changes would provide greater clarity within the standard. R2.1.3 & R2.4.3 – Recommend "when known outages are scheduled" be changed to "when known outages **occur**" to provide greater clarity. R2.4.3 – The objective for including known outages in TPL-001-5 should be to ensure that all types of known outages are being reviewed while keeping the burden of additional stability analyses within reason. As currently drafted, the standard would require both steady state and stability analyses for all known outages included in the Planning Assessment. LES recommends modifying the standard to allow steady state analyses and limit stability analyses based on the use of Engineering Judgement in the Transmission Planner's technical rationale for selecting known outages. Recommend changing R2.4.3 to state "…under those System peak or Off-Peak conditions when known outages occur **and have been identified as requiring Stability analysis**". Footnote 13a: To ensure "comparable" isn't mistaken to mean having identical Clearing times, LES suggests revising footnote 13a to instead state "…that provides comparable**, but not necessarily identical,** Normal Clearing times". Footnote 13c: LES recommends removing "open circuit" from Footnote 13c. The absence of open circuit monitoring is too restrictive to consider a single station DC supply as non-redundant. Both a battery charger and battery provide DC supply redundancy because either device can provide DC power if the other device fails or has an open circuit. Additionally, PRC-005 provides adequate testing for open circuits.

Response	

Requirement R2, Parts 2.1.3 and 2.4.3:
This language was revised substantially.

Part 2.4.3: The use of a technical rationale to determine the "significant outages" which must be studied is already in the standard. There is nothing in the language that prevents LES, from running a separate set of "significant outage" on stability compared to steady state as long as this is documented in the technical rationale.

Footnote 13a: The SDT has made a clarification about what a comparable clearing time represent for purposes of footnote 13 in Section 4 of the technical rationale.

Footnote 13c: The SDT believes that an open circuit on the DC supply will cause a protection failure so both open circuit and low voltage must be monitored **OR** redundant battery and charger is required if performance requirements of the study are not met. The SDT believes that in some cases like in bus differential protections, the charging system will not have enough current to send a signal to all the trip coils that must be activated. Therefore, the charging system is not sufficient backup for the DC supply. TPL-001 is a standard for identifying studies required in order to plan the system. PRC-005 is a maintenance standard for identifying the maintenance periods. There is no correlation to these two standards.

Comment	

In the response to Question 1, we voiced our concerns on the inclusion of P8. Rather than its inclusion, one possible alternative would be to redefine the definition of Delayed Fault Clearing to only include backup protection system with an intentional time delay. A separate term could be created for Breaker Failure Fault Clearing. Note that in the NERC technical paper "Protection System Reliability Redundancy of Protection System Elements" by the NERC System Protection and Control Subcommittee dated January 2009, page 13, the

committee had to clarify the term for the purpose of their paper. Currently, this white paper is the primary source of guidance for this very complex topic. Due to the expansion of non-redundant components included in the proposed draft of the Standard, the terms provided in the NERC Glossary need to be further developed in order to provide clarity for their new application to this standard. As stated in previous comment periods, we believe usage of the word "comparable" within footnote 13a is ambiguous. While we are not completely certain, we suspect the SDT means "less than or equal to" when using this word. If so, it would be preferable to instead state "A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides a clearing time less than or equal to Normal Clearing times;" In both 13b and 13c, using the word "or" within "is not monitored or not reported at a Control Center" may not be consistently interpreted. Any possible confusion might be eliminated by instead using either "not monitored at a Control Center" or "is not monitored *and* not reported at a Control Center" in both 13b and 13c.

Response	
The P8 event was removed and a three phase fault remains an extreme event. Additional clarification has been made in the technical rationale around the word "comparable". Footnote 13b and 13c have been modified and a language was added to the technical rationale to clarify what was meant with monitored and reported to a control center.	
Fred Frederick - Southern Indiana Gas and Electric Co. - 3	
Answer	No
Document Name	
Comment	

We feel that more explanation/guidance is needed to address what is and isn't included in the "components of a Protection System." The research to determine which of these components is a single point of failure, and what the delayed clearing time would be, is potentially quite expansive. We would like to have a more clear idea of the scope of this work and how the impacts differ from P4 and the existing P5 contingencies.

Dislikes 0	
Response	
The SDT appreciates these comments. The answers to your questions are very lengthy for inclusion in this response. There are many added details the SDT put into the technical rationale which follows this standard. There are many times when a P4 and P5 are the same study, however the CAP will need to include mitigations for both the P4 and P5 so both requirements had to be listed in the standard for the reliability improvements that are necessary. There are also times when a P4 and P5 are different. A bus differential protection system is one example where a P4 andP5 result in different studies. Please refer to the technical rationale all answers to your comments. If you still have questions, contact the NERC staff and more language can be added to the technical rationale in order to make it clearer.

Answer	No
Document Name	
Comment	
CHPD disagrees with the proposed revision to TPL-001-4. Particularly, the inclusion of the new Planning Event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 sub-requirement 4.5 for Extreme Events and Cascading (keep this section unchanged from the current TPL-001-4 standard).	

In moving the three-phase fault with protection system failure from an Extreme Event to a P8 Planning Event, the SDT has also changed the required performance levels from that of the Extreme Event to those of the planning standard, which creates an undue burden. Also, while the SDT stated in their Consideration of Comments to TPL-001-5 Draft 2 Question 1 “the SDT decided to make the three-phase fault followed by a protection failure a P8 event with no Cascading allowed or a Corrective Action Plan (CAP) requirement,” the current language of the proposed standard doesn’t clearly state that a CAP isn’t required. CHPD disagrees with these changes. The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate. Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure in Protection System (for single phase faults) as well as the recommendations from the Joint Report from SPCS and SAMS. The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13. However, CHPD would like to see non-redundant but monitored relays and control circuitry (as defined in Table 1 Footnote 13.a. and 13.d.) have the same exclusion as the monitored communication systems and station dc supplies as allowed in Table 1 Footnote 13.b. and 13.c. for Planning Events P5 and P8. CHPD suggests the SDT restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This adequately addresses FERC’s concern regarding three phase faults from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

Comment	

PRPA supports JEA comments.

JEA disagrees with the proposed revision to TPL-001-4. Particularly, the inclusion of the new planning event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 subrequirement 4.5 for extreme events and Cascading (keep this section unchanged from the current TPL-001-4 standard).

The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate.

The inclusion of measures (M) for each Requirement is appropriate.

The clarifications added for the planned maintenance outages of significant facilities from future planning assessments are appropriate and seem to adequately addresses the Commission's directive from Order No. 786 Paragraph 40.

The clarifications added for entity's spare equipment strategy for the unavailability of long lead time items are appropriate and seem to

adequately addresses the Commission's directive from Order No. 786 Paragraph 89. The replacement of the 'Special Protection Systems' with 'Remedial Action Schemes' is appropriate. Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure Unofficial Comment Form Project 2015-10 and Single Points of Failure | February 2018 5 in Protection System (for single phase faults) as well as the recommendations from the joint report from SPCS and SAMS. The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13. Suggestion: Restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This should adequately address the Commission's concern (for three phase faults) from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

The SDT appreciates the comments provided by JEA and PRPA. The SDT agrees and has removed the P8 event and made the three-phase fault followed by a failure of the protection system an extreme event. All associated language was also revised.	
Sergio Banuelos - Tri-State G and T Association, Inc. - 1,3,5 - MRO,WECC	
Answer	No

Document Name	
Comment	

Tri-State does not agree with the language of Footnote 13:

Footnote 13 is weakly worded and suggests that elements of a protection system should be consider rather than shall be studied. Stronger language which clearly defines what components of a protection that are included and what are excluded should be used.

Section D: The standard does not adequately explain the difference between a breaker failing to operating and failure of an element of a protection system resulting in the breaker failing to operate. In most cases, the protection events and post-contingency system states are identical. An addendum or reference to technical documentation which clearly explains the scenarios where they may differ should be included.

Dislikes 0	

Response

For P5: The first step is the TP/PC must identify a list of Facilities to be studied per the technical rationale. Then in determining the delayed clearing time for completing the studies, components of footnote 13 must be considered. The components with the longest clearing time should be identified to be able to adequately perform the stability portion. When the stability portion is complete, if there are no performance requirement violations then that portion of stability is complete, no CAP is required. If however the performance requirements are not met, then the TP/PC must identify the critical clearing time where the stability analysis meets the performance requirements. All components of footnote 13 that result in a delayed clearing time longer than the critical clearing time must be considered when identifying a CAP. For example, if a failure of a relay and trip coil both result in a delayed clearing time greater than the critical clearing time, a redundant relay AND redundant trip coil will be required in the CAP. Adding a redundant relay alone is not good enough in this example. Since language in the actual standard cannot include many of the details, some details of how to complete the assessment for P5 was put into the technical rationale. The SDT appreciates these comments concerning footnote 13. The SDT has difficulty creating an exhaustive list of exactly what components of a protection system should be included. It is likely that something would get missed when this list would need to apply to all existing protection systems from the east coast to the west coast. The SDT utilized NERC Technical Paper dated November 2008 titled *"Protection System Reliability Redundancy of Protection System Elements"*

which does a better job of defining all the equipment that must be redundant. Language was added to the Technical Rationale which follows the standard. Entities should utilize the technical rationale when developing the portions of a protection system that must be redundant when performance requirements are not met as a result of the study.

JEA disagrees with the proposed revision to TPL-001-4. Particularly, the inclusion of the new planning event P8 is unwarranted and should be deleted along with the associated CAP and the implementation plan, and all the changes made to the performance requirements at the top of Table 1 (Performance Planning Events – Steady State & Stability) associated with the proposed P8 event, i.e., there is no change required in this section from the current TPL-001-4 standard (from Order No. 786). Similarly, no changes are required for requirement R4 sub-requirement 4.5 for extreme events and Cascading (keep this section unchanged from the current TPL-001-4 standard).

The replacement of the retired standards MOD-010 and MOD-012 with MOD-032 is appropriate.

The inclusion of measures (M) for each Requirement is appropriate.

The clarifications added for the planned maintenance outages of significant facilities from future planning assessments are appropriate and seem to adequately addresses the Commission's directive from Order No. 786 Paragraph 40.

The clarifications added for entity's spare equipment strategy for the unavailability of long lead time items are appropriate and seem to adequately addresses the Commission's directive from Order No. 786 Paragraph 89.

The replacement of the 'Special Protection Systems' with 'Remedial Action Schemes' is appropriate.

Clarifications added to the planning event P5 along with the new Footnote 13 are appropriate and seem to adequately address the concerns that the Commission raised with single points of failure in Protection System (for single phase faults) as well as the recommendations from the joint report from SPCS and SAMS.

The updated Footnote 13 adds clarity to the standard and addresses all the recommendations from the Joint Report from SPCS and SAMS for Footnote 13.

Suggestion: Restore the language from the last draft (Sept. 2017 version) under Table 1 – Extreme Events – stability bullets 2e through 2h (without the proposed 4.6 of draft 1 or the proposed 4.2.1 and 4.2.2 of draft 2) to address the recommendation from the Joint Report from SPCS and SAMS regarding the three phase faults together with single points of failure in protection system. This should adequately

address the Commission's concern (for three phase faults) from Order No. 754 as well as the recommendations from the Joint Report from SPCS and SAMS.

The proposed change to requirement R1, part 1.1.2 to eliminate the six month minimum duration requirement for considering known outages introduces duplication of the studies currently performed in TOP-003 and IRO-017 Operational Planning Assessments. Removing the six month threshold also adds a considerable burden on the annual Planning Assessment without providing significant value by requiring studies be performed for short term maintenance outages in the Planning Horizon. The annual TPL-001-4 Planning Assessments represent projected system conditions in the near-term and long-term planning horizons and are not meant to identify operational concerns for outages shorter than six months. The system models used in the Planning Assessment represent a general snapshot of stressed system conditions with all facilities in-service. Daily operational conditions almost never have the system entirely intact and available due to necessary system maintenance and testing. In addition, the information regarding planned outages occurring beyond year one of the near-term planning horizon would be expected to be limited or unavailable as most outages are scheduled within two months of the requested outage time. For these reasons, outages shorter than six months are more accurately addressed in the operations planning horizon, when more information is available regarding overlapping outages and current system conditions.	

Planned outages are considered in Operational Planning Assessments. T**he IRO-017 standard establishes the outage coordination process** within the operations planning horizon, which covers the period from day-ahead to one year out. The outage coordination process includes development and communication of outage schedules, evaluating impacts and developing operating plans to mitigate outage conflicts, or rescheduling outages when necessary in order to reduce the reliability impact of the critical outage. This process ensures a more accurate modeling of expected system conditions, including information on concurrent outages.

Response	
IRO-017 R4 requires coordination of the RC and TP/PC related to outages in "Time Horizon: Long-term Planning", while the Operations Planning is in the "Time-Horizon: Operations Planning". The SDT does not feel that there is an overlap due to the "Time Horizon" as written in IRO-017. Due to FERC Order No. 786, outage duration alone should not be used to determine significant outages. The SDT feels that a test or study should be used to determine significant outages. This test or study should be documented in a technical rationale. Similarly, TOP-003 operational studies are performed in the Operations Planning Time Horizon. So without TPL-001-5, at present the SDT believes there is a gap in being able to complete the requirements of IRO-017 Requirement R4. The FERC Order No. 786 required the language in TPL-001-4 Requirement R1 be revised to include outages with a shorter duration than six months. The test or study documented in the technical rationale can be used to identify a smaller list of "Significant Outages" to make this manageable. The TP/PC has a list of projects required as a result of the planning assessment in the Near-Term Transmission Planning Horizon. The TO should know what outages are required in order to build the projects that the TP/PC identified in the planning assessment. A MOD-032 data request can be used by the PC to identify the lists of outages that could occur in the Near-Term Transmission Planning Horizon.

Table 1, Footnote 13 – The ability to monitor the status of a Protection System Component does not fully mitigate the risk of the failure of a non-redundant component. The exception of 13b is not consistent with the requirements for redundancy in protective relays, even though the components can be very similar in design and performance.

For 13.b, consider removing the qualification, “which is not monitored or reported within 24 hours at a Control Center”. If the SDT believes the qualifications for monitoring and reporting are valid for the communication channel for a communications based relay scheme and elects to leave this, then ITC would only then suggest to add the same “which is not monitored or reported within 24 hours at a Control Center” qualification to 13.a . ITC, however, believes the better wording for the standard is to not have this gualification in either 13.a or 13.b.

Response

Footnote 13 is not attempting to define what a redundant protection system is for other NERC standards. Footnote 13 is only for TPL-001-5 assessments. In Footnote 13 a risk based approach was considered and consisted to classify the component with higher/ lower risk of reliability impact from Single Points of Failures as mentioned in Footnote 13a to 13d.

Even if monitoring is not equal to redundancy, for lower risk of reliability impact components (based on NERC 2014 analysis), the monitoring is considered sufficient and will allow excluding the associated components from P5 event study.

TPL-001-4 P5 event is applicable to non-redundant relays and does not allow for monitoring. The SDT does not want to reduce the bar from TPL-001-4 by adding monitoring. A single point of failure of a protective relay will result in delayed fault clearing. Moreover, the failure may remain undetected until the relay is tested, depending on the relay type (electromechanical relay, microprocessor relay) and protection system design.

According to the NERC State of Reliability 2014 report, the top causes of failure are: incorrect setting, logic, or design error, relay failures/malfunctions. Relays have higher rate of failure compared to station dc supply and communication system. Therefore, the protection system design must consider the protective relays exposure to higher risk of failure. Thank you for this comment.

We do however propose the following improvements : • Requirement 2.5 addresses "material generation additions or changes". These additions or changes should already have been included in the model as per (renumbered) R1.1.3. Thus 2.5 is superfluous. However if SDT retains this requirement, it should also address other material additions or changes such as load increase or relocation. • Requirement 2.7.1: Examples should not be in a requirement, they should be moved to guidance. • Replace « assessment » in requirements 3.3.1.1 and 4.3.1.2 with « Planning Assessment »

While OUC agrees with the addition of P8, OUC believes clarity needs to be added to Requirement 1 in order to avoid the TPL-001-5 standard overlapping with Operations Planning, and believes an outage duration would be an appropriate way to filter outages of less significance that Operations Planning would otherwise be assessing day-to-day.	
Likes 0	
Dislikes 0	
Response	
Due to industry comments, P8 was removed and the three-phase fault followed by a protection failure will be in extreme event. Changes were made to Requirement 1 related to known outages. IRO-017 Requirement R4 requires coordination of the RC and TP/PC related to outages in “Time Horizon: Long-term Planning”, while the Operations Planning is in the “Time-Horizon: Operations Planning”. The SDT does not feel that there is an overlap due to the “Time Horizon” as written in IRO-017. Due to FERC Order No. 786, outage duration alone	

should not be used to determine significant outages. The SDT feels that a test or study should be used to determine significant outages. This test or study should be documented in a technical rationale.

We generally agree with the changes, except for R1.1.2.1 as noted above. Also, Is there a need to consider a three-phase fault on a shunt device with a stuck breaker resulting in Delayed Fault Clearing? (See Table 1 Stability Extreme Events) It appears this item is missing.	
Likes 0	
Dislikes 0	
Response	
The known outages in Requirement 1 was removed, but studies related to known outages was revised. Related to Table 1 Stability Extreme Event comment: This may have been an oversight from the SDT for TPL-001-4. However, the SAR does not allow the SDT of TPL-001-5 to correct potential issues of TPL-001-4.	
John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1	
Answer	Yes
Document Name	
Comment	
The following questions/requests were previously submitted; however, Tacoma Power is not clear about the drafting team's responses. 1. If monitoring of Protection System components is counted for purposes of TPL-001-5, is it the drafting team's intent that an entity would be obligated to maintain the alarming paths and monitoring systems under PRC-005-6 (Requirement R1, Part 1.2, and Table 2)? An	

entity should be allowed to consider monitoring for purposes of TPL-001-5 but treat the associated Protection System component(s) as unmonitored for purposes of PRC-005-6. 2. Additional clarification is requested on the demarcation between station DC supply and control circuitry for purposes of TPL-001-5. It is recommended that the main breaker of DC panels be considered part of the station DC supply.	
Likes 0	
Dislikes 0	
Response	
1. The SDT cannot and should not comment on PRC-005. 2. The control circuitry begins where the DC supply ends. There are diagrams that may be helpful contained in the technical rationale.

It is recommended that for P5 and P8 events in Table 1, the Drafting Team consider modifying the phrase "Fault plus non-redundant component of a Protection System failure to operate" to "Fault plus single component of a Protection System failure to operate" and modifying the phrase "Delayed Fault Clearing due to the failure of a non-redundant relay component of a Protection System protecting the Faulted element to operate as designed" to "Delayed Fault Clearing due to the failure of a single component of a Protection System protecting the Faulted element to operate as designed". Similarly, note 13 in Table 1 might be modified to read "For purposes of this standard, failure of a single component of a Protection System is considered to be as follows". It is suggested that this language might describe the same event a bit clearer, and in a way consistent with the description of similar failure for RAS as described in PRC-012-2. This would avoid any potential debate over the definition of redundancy - in order to determine what is a "non-redundant" component, one needs to define what does and does not constitute redundancy in this context (e.g., What about a backup relay that performs similar functions, but is not exactly the same? What about a duplicate relay with slightly different settings, or configured in the system in such a way that it responds a little slower? What if there is a "redundant" trip coil in a breaker, but it's not hooked up?). It would also clarify that for the case of multiple non-redundant components in a particular Protection Scheme, that the simultaneous failure of all non-redundant components is required to be considered (we assume the intent in such a case would be to consider failure of each non-redundant component one at a time).

As provided in previous comments periods, Exelon recommends removing communication systems from footnote 13 in the revised standard. The SPCS concluded that the analysis of communications systems with regard to single points of failure did not pose enough of a risk for inclusion in footnote 13. As noted in the "Consideration of Comments", the SDT "augmented the SAMS/SPCS recommendations to include the reference to the subset of communications systems that are part of a communication-aided Protection System". By doing this, the inclusion of communications systems extends beyond the scope of the SAR to "[c]onsider the recommendations for modifying

NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) as identified in the SPCS and SAMS report." Requirement R2.7 should be revised to reference Requirement R2, Parts 2.1.4 and 2.4.4 and not Requirement R2, Part 2.4.3 based upon the currently proposed draft. Requirement 2.4.4 is specific to the sensitivity studies. The SDT should consider aligning the language in Requirements R3, Part 3.5 and R4, Part 4.2: "If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted."

Response	
The SDT removed the P8 event and a three phase fault followed by a protection failure remains an extreme event. The SDT feels that the suggested language changes to Table 1 appear to make less clarity instead of adding clarity. The SDT added a significant amount of clarity in the technical rationale for what is redundant and what is not redundant for purposes of TPL-001-5 only. The SDT members are not sure what is meant in this comment by the simultaneous failure of all non-redundant components of a protection system. The TP/PC can consider the components one at a time and this potentially means four simulations. Or the TP/PC could consider studying the worse delayed clearing time and discuss with the protection group which parts of footnote 13 cause performance criteria violations. The task is to determine which components of Table 1 footnote 13 are redundant (meaning backups have the same clearing time) or are monitored. If monitored or redundant for footnote 13b, c and d and redundant for footnote 13a, then no P5 stability simulations are required at this location. If they are required for simulation (not redundant and not monitored), then a determination of whether it meets performance requirements is done. If performance requirements are not met, then the CAP could be four things: Example of the four things in the CAP at the same location could be redundant relay, redundant DC control circuitry, redundant DC supply and redundant communications.	

The addition of communication systems was discussed extensively and while it is true, the SAMS and SPCS report did not include this particular recommendation, the SAMS and SPCS report did contain a potential risk. The SDT attempted to minimize the impact of adding communications by also allowing it to be monitored or redundant.

The SDT made changes to Requirement R2, Parts 2.1.4, 2.4.4, Requirement R3, Part 3.5 and Requirement R4, Part 4.2 which we feel satisfies your comments to this portion.

5. *Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754?*

Not only are some of the proposed changes from the SDT out-of-scope from the SAR and cost-prohibitive such as the addition of planning event P8, but the added reliability benefit is marginal for such a rare event compared to the cost, logistics, coordination and the aggressive implementation schedule that will be needed to achieve the desired outcome. Additionally, the implementation plan to achieve performance requirements for the modified P5 with single points of failure definitely needs an industry input. JEA is not	

disagreeing with the changes for P5 (please see our prior comments) but a more pragmatic approach is needed to address the industry concerns with CAP implementation to meet the Commission's directives especially in Order No. 754. **Suggestion**: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, JEA recommendations for NERC to survey the industry (PCs, TPs and Facility owners) with another **Request for Data Under Section 1600 of the NERC Rules of Procedure** for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual **ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP)**.

BPA feels that it is not cost effective to plan and construct a project for a planned outage of short duration that would be coordinated ahead of time according to outage planning processes (development of an operating plan) and would not be planned during peak seasons. It would also not be cost effective to plan and construct a project for a planned outage of short duration when planned outages of the same facility are not expected again in the foreseeable outage planning timeframes.

AZPS notes that it believes that, with the exception of Requirement 1, Part 1.1.2, the proposed TPL-001-4 is cost effective. As stated in response to Question 2 above, AZPS recommends that a definitive time period of "more than 3 months" be added to Requirement 1, Part 1.1.2. The inclusion of outages that are 3 months or less creates unnecessary study burden with little or no added reliability benefit and the currently proposed criteria increases the potential for inconsistency relative to planning assessments, which inconsistency increases costs while eroding the overall reliability benefit anticipated. Please refer to AZPS's response to Question 2 for additional details.

Comment	

Absolutely NOT. The SDT has not presented a solid cost effective analysis on the proposed changes leaving industry seriously questioning the process and the amount of work that would be potentially created by these changes and the minimal return on investment.

ADDITIONAL COMMENTS

1. In reviewing the edits to R1.1.2, I'm still concerned about the vagueness of those outages that must be modeled and whether such consultation will now require the RC to meet with each TP and PC separately within the FRCC on an annual basis.

2. Given the changes to requirement R1.1.2, we believe there needs to be applicability in the standard to the Reliability Coordinator and not just the PC and TP. Also, since the SDT struck out the duration of six months in R1.1.2, there should be a time-frame around the length of transmission outages given some outages are only for a few hours, some for a day, a week, a month, etc., that may not be covering the year, season, or load level entities are assessing. (3) Regarding the edits to R1.1.2, what happens if the RC, TP, or PC disagree as to which outages to include in the System models? Is it acceptable to the SDT if procedures are written whereby not all entities are in agreement with which outages to include? (4) In R2.1.5, the SDT changed "studied" to "assessed". Can the SDT provide background on what is now expected with the term "assessed" differently than what was performed under the term "studied"? (5) In R2.4.5, can the SDT elaborate on what is expected in, and how detailed, an entity's spare equipment strategy should be that is needed for TPL-001-5? (6) In R2.4.5, the wording "The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment" opens entities up to major compliance interpretation issues as it's not certain that entities will evaluate ALL conditions that the System is expected to experience in our Planning Assessment, this needs to be further clarified by the SDT. (7) P5, and footnote 13, was modified to cover non-redundant components of a Protection System. This is a substantial additional burden onto entities. Seminole requests the team to perform a cost effectiveness study concerning these additional edits. (8) In the Cost effectiveness Document updated(3/8/2018), pg 3 Footnote 13-(2 single-station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), How is this not a single point of failure?

The proposed revision is potentially not cost effective depending on the clarification requested in question 4. We feel that more explanation/guidance is needed to address what is and isn't included in the "components of a Protection System." The research to determine which of these components is a single point of failure, and what the delayed clearing time would be, is potentially quite expansive. We would like to have a more clear idea of the scope of this work and how the impacts differ from P4 and the existing P5 contingencies.

Table 1, Footnote 13.d is not expected to be cost-effective as written. While the Standard Drafting Team chose wording to offer some flexibility for applicable entities to meet the requirements of Footnote 13.d, the vagueness of the current language is expected to lead to differences in interpretations between applicable entities and regulators. To avoid the risk of being judged non-compliant, applicable entities will need to assume a very liberal interpretation of Footnote 13.d and engage in an immense scope of work, which may find little or no adverse BES reliability impacts. The investigation of existing control wiring and development of applicable contingency descriptions are expected impose a very large demand on labor resources. We propose that the SDT defer imposing a “non-redundant control circuitry” requirement on the industry until the scope of work can be limited to cost-effective level through risk-based inclusion/exclusion criteria and more clear definition of applicable control circuitry. If the Standard Drafting Team (SDT) does not add the proposed Footnote 14 in Table 1 (which makes it clear that TPs and PCs can perform the 3-phase fault simulations in a way that avoids unnecessary and duplicative SLG fault simulations), then the proposed standard may

lead entities and regulators to interpret that a significant amount of unnecessary and duplicative P5 event analysis is required for compliance. The unnecessary and duplicative P5 event analysis would not be cost-effective.

Proposed TPL-001-4 is not the most cost-effective way of meeting the FERC directives because the standard will compel the PC and TP to expend additional costs and staff resources to prepare and implement a CAP for P8 events, which is not required by Order No. 754. Because P8 events are considered to be rare occurences in the industry, requiring a CAP is not a effective use of resources. The following conclusion statement in the Joint Report on Order 754 supports this position: "This concern (the study of protection system single points of failure) is appropriately addressed as an extreme event in TPL-001-4 Part 4.5". *See Order 754 Assessment at p. 11.*

MEC supports NSRF comments. In addition, the zero defect compliance work to maintain perfect protection system drawings and change management is significant with little additional actual system reliability gain due to the rare probability of a delayed cleared fault combined with a single-point-of-failure protection component failure that isn't already known. NERC and industry should work together to seek a better risk based strategy to focus on important substations. Examples could be the use of voltage class levels similar to FAC-003 (200kV and above or as identified by the RC / PA), high fault current levels similar to PRC-002, or number of transmission interconnections similar to the FERC Order 754 effort.

1. The required analysis of all scheduled outages in the near term horizon is not cost-effective, as it will result in many studies being run without meaningful results and/or with time spent "proving the negative".

2. Introducing a new type of event in Planning Event P8 creates unnecessary compliance burden and is illogical. Furthermore, it opens up industry to additional illogical changes to a planning standard that was generally working pretty well before these changes.

3. Flatly requiring P1/P2 events be studied in stability is likely to simply create busy work since an entity may (not a guarantee – based on details specific to each facility and engineering judgment) determine that a P4 or P5 is more appropriate to simulate, but would be required to run the P1 or P2 event regardless (e.g. in addition to those events the entity feels are best to study).

To determine if something is cost-effective, the analysis must consider alternatives to achieve a measurable outcome.

The FERC directives are narrowly drafted without significant alternatives to fulfill their outcomes. Reflected in the proposed revisions and Implementation Plan are the directives' narrow framework and, as such, a meaningful analysis of the revisions and Plan's cost-effectiveness is indeterminable.

Not only are some of the proposed changes from the SDT out-of-scope from the SAR and cost-prohibitive such as the addition of planning event P8, but the added reliability benefit is marginal for such a rare event compared to the cost, logistics, coordination and the aggressive implementation schedule that will be needed to achieve the desired outcome. Additionally, the implementation plan to achieve performance requirements for the modified P5 with single points of failure definitely needs an industry input. We do not disagree

with the changes for P5 (please see our prior comments) but a more pragmatic approach is needed to address the industry concerns with CAP implementation to meet the Commission's directives especially in Order No. 754. Suggestion: Remove the proposed P8 event along with the associated CAP and the Implementation Plans. For the new CAPs with the newly-added studies for P5 planning events only with single points of failure on Protection System, Rrecommend NERC survey the industry (PCs, TPs and Facility owners) with another Request for Data Under Section 1600 of the NERC Rules of Procedure for a more realistic implementation schedule. Or alternatively, request and track the implementation plans for CAPs for such P5 events from the industry as part of the annual ERO Enterprise Compliance Monitoring and Enforcement Program (CMEP).

The proposed revisions to this Standard would add significant resource and financial burden to TOs and GOs. Recommend for the SDT to evaluate System performance issues thru planning studies prior to making Corrective Action Plans (CAPs) mandatory in the Implementation Plan. This would provide time for the SDT to evaluate the impact and cost implications that these new Requirements have on industry. After an evaluation is done, then the SDT can determine what CAPs would be required and reduce the financial impacts to industry by utilizing a separate Implementation Plan.

1. We believe a more cost effective way approach to meeting the FERC directives exists. The proposed changes should allow registered entities the flexibility to determine how they will address this BES reliability risk. The currently proposed solution requires a registered entity to conduct a duplicative contingency analysis for a three-phase fault that is less likely to occur than a single-phase-to-ground fault under similar conditions. 2. The “dc supply” reference to open circuit within Footnote 13c could require an entity to purchase additional equipment based on the accepted configuration. We recommend revising the footnote to only consider when the dc supply is not monitoring or reporting abnormal DC voltages. 3. We thank you for this opportunity to comment.

There is some correlation between FERC directives in Order NO. 786 and Order No. 754 such as a Tranmission Planner assessing their portion of the Bulk Electric System (BES) for locations at which a three-phase fault accompanied by a protection system failure could result in a potential reliability risk (Order No. 754) and the expansion on Protection System Failures versus Relay Failures (Order No. 786). However, EEI summarized it best by stating in Order No. 786 (p. 46), "...expanding planning studies to include all manner of protection system failures could create a scenario where planners would have to conduct unlimited and unbound studies."

The potential for unlimited studies to include all manner of protection system failures is not a cost effective way of meeting both FERC directives. This new revision expands the purview from relay failure to failure of all protection system components. Additionally, this requirement (and its predecessor) required assessments of entire system unlike the limited ones per FERC order 754.

OUC would recommend providing some guidelines in order to guide the discussion on how to solve issues found under new Planning Event 8, such as recommending Zone 2 or Zone 3 protection where applicable (if acceptable though testing) or the addition of dual and separate DC sources. Guidelines on what actions to take and when to take them (along with cooridinating these upgrades with the company's protection group) would help further keep the revisions cost-effective by providing a methodology of least cost options to higher cost options.

While the proposed revisions to TPL-001-4 along with the Implementation Plan may be a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754 in terms of corrective action plans, the proposed revisions will present a very significant burden on Planning and Engineering staffs to investigate and identify "non-redundant" components of a Protection System. This incremental burden will have adverse cost impacts.

Comments received from APPA

Questions

1. Do you agree with the creation of the proposed P8 event?

☐ Yes
x☐ No

Comments: APPA concurs with the JEA comments that the addition of the P8 event is beyond what was in the Standards Authorization Request (SAR).

2. Do you agree with the changes to TPL-001-4 Requirement 1, Part 1.1.2, in order to meet the FERC directive in Order No. 786?

y☐ Yes
☐ No

Comments:

3. Do you agree with the proposed implementation plan?

☐ Yes
x☐ No

Comments: APPA believes the 36 month period for the proposed standard to be effective is appropriate as is the 24 month period for development of the CAP. However, we do endorse the overall implementation plan and support the reasoning for that lack of support provided in JEA's comments. Similarly, we support the JEA suggestion to remove the proposed P8 event and its associated CAP and seek industry feedback on a more feasible implementation plan.

4. Do you agree with the proposed revisions to TPL-001-4?

☐ Yes
x☐ No

Comments: APPA believes that the proposed revisions to TPL-001-4, especially the inclusion of P8 is not workable and supports the JEA comments and suggestions.

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754?

☐ Yes
x☐ No

Comments: APPA believes the proposed revisions and implementation plan will not result in a cost effective way to meet the FERC directives in Order No. 786 and Order No. 754. The inclusion of event P8 is the driver for increasing the costs of the proposed standard. Importantly, the increased costs are not commensurate with a material improvement in reliability.

Public power endorses the JEA comments and suggestions.

End of Report

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-5**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

    4.1. Functional Entity

    4.1.1. Planning Coordinator.

    4.1.2. Transmission Planner.

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

1.1.2. New planned Facilities and changes to existing Facilities.

1.1.3. Real and reactive Load forecasts.

1.1.4. Known commitments for Firm Transmission Service and Interchange.

1.1.5. Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within its respective area, using data consistent with MOD-032 including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short

circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning coordinator or Transmission Planners's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. The analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.

- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments, but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.3 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission

Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

3.3. Contingency analyses for Requirement R3, Parts 3.1 and 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each

Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. **Compliance Monitoring Process**

    1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

    1.2. **Evidence Retention:** The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit

    The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

    - Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

    1.3. **Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

    1.4. **Compliance Monitoring Period and Reset Timeframe:**

    Not applicable.

    1.5. **Compliance Monitoring and Enforcement Processes:**

    - Compliance Audits
    - Self-Certifications
    - Spot Checks
    - Compliance Violation Investigations
    - Self-Report
    - Complaints

    1.6. **Additional Compliance Information:**

    None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.5. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-032 standards and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

1	Approved by Board of Trustees February 17, 2011	Revised footnote 'b' pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR	

Version	Date	Action	Change Tracking
		proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote ‘b’ in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Version	Date	Action	Change Tracking

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability: a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only:** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault[8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker)[8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker[10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer[5] 3. Shunt Device[6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

<table>
<tr><th colspan="2">Table 1 – Steady State & Stability Performance Extreme Events</th></tr>
<tr><td colspan="2">Steady State & Stability
For all extreme events evaluated:
a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
b. Simulate Normal Clearing unless otherwise specified.</td></tr>
<tr><td>Steady State
1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
a. Loss of a tower line with three or more circuits.[11]
b. Loss of all Transmission lines on a common Right-of-Way[11].
c. Loss of a switching station or substation (loss of one voltage level plus transformers).
d. Loss of all generating units at a generating station.
e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
a. Loss of two generating stations resulting from conditions such as:
i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.</td>
<td>Stability
1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
a. 3Ø fault on generator with stuck breaker[10] resulting in Delayed Fault Clearing.
b. 3Ø fault on Transmission circuit with stuck breaker[10] resulting in Delayed Fault Clearing.
c. 3Ø fault on transformer with stuck breaker[10] resulting in Delayed Fault Clearing.
d. 3Ø fault on bus section with stuck breaker[10] resulting in Delayed Fault Clearing.
e. 3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.
f. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.</td></tr>
</table>

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	g. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. h. 3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. i. 3Ø internal breaker fault. j. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss. 2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria. 3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss. 4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service. 5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. 6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground. 7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point. 8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker. 9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. 10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. 11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less. 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction. 13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows:

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (except a single communications system that is both monitored and reported at a Control Center shall not be considered non-redundant); c. A single station dc supply associated with protective functions required for Normal Clearing (except a single station dc supply that is both monitored and reported at a Control Center for both low voltage and open circuit shall not be considered non-redundant); d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices, required for Normal Clearing (except a single trip coil that is both monitored and reported at a Control Center shall not be considered non-redundant).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder’s satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
    a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community

3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**
2. **Number:** **TPL-001-~~4~~5**
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

~~5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

~~Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

~~For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-4, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-4:~~

- ~~P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P2-1~~
- ~~P2-2 (above 300 kV)~~
- ~~P2-3 (above 300 kV)~~
- ~~P3-1 through P3-5~~
- ~~P4-1 through P4-5 (above 300 kV)~~

- ~~P5 (above 300 kV)~~

~~B. Requirements~~

5. Effective Date: See Implementation Plan.

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-~~010 and MOD-012 standards~~032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

~~**1.1.2.** Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.~~

~~**1.1.3.**~~**1.1.2.** New planned Facilities and changes to existing Facilities.

~~**1.1.4.**~~**1.1.3.** Real and reactive Load forecasts.

~~**1.1.5.**~~**1.1.4.** Known commitments for Firm Transmission Service and Interchange.

~~**1.1.6.**~~**1.1.5.** Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within ~~there~~ its respective area, using data consistent with MOD-032 including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

~~**2.1.3.** P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.~~

~~**2.1.4.**~~**2.1.3.** For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning coordinator or Transmission Planners’s portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be ~~studied~~assessed. The ~~studies~~analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

~~2.4.4.~~2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments, but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.~~4~~3 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or ~~Special Protection Systems~~ Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the

Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

3.3. Contingency analyses for Requirement R3, Parts 3.1 ~~&~~and 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1~~,~~ that are expected to produce more severe System impacts on its portion of the BES~~,~~ shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. ~~If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.~~

~~**M1.**~~**M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer

simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a ~~Special Protection System~~Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.~~If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.~~

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information:

None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.5. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-032 standards and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4.	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for one of the categories (P1 through P7) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for two of the categories (P1 through P7) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P7) in Table 1. OR

R #	Violation Severity Levels

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to "0.1"	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote 'b' pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR	

Version	Date	Action	Change Tracking
		proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote 'b' in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Version	Date	Action	Change Tracking

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability: a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only:** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault[8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker)[8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker[10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus ~~relay~~non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant ~~relay[13]~~component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer[5] 3. Shunt Device[6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
   a. Loss of a tower line with three or more circuits.[11]
   b. Loss of all Transmission lines on a common Right-of-Way[11].
   c. Loss of a switching station or substation (loss of one voltage level plus transformers).
   d. Loss of all generating units at a generating station.
   e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
   a. Loss of two generating stations resulting from conditions such as:
      i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
   a. 3Ø fault on generator with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   b. 3Ø fault on Transmission circuit with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   c. 3Ø fault on transformer with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   d. 3Ø fault on bus section with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   e. 3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.
   f. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	g. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. h. 3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. ~~e.~~ i. 3Ø internal breaker fault. ~~f.~~ j. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)

10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. ~~Applies~~For purposes of this standard, non-redundant components of a Protection System to ~~the following~~consider are as follows:
    a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times;
    b. A single communications system associated with protective functions~~ or types: pilot (#85), distance (#21), differential (#87), current (#50, 51,~~, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (except a single communications system that is both monitored and ~~67),~~reported at a Control Center shall not be considered non-redundant);
    c. A single station dc supply associated with protective functions required for Normal Clearing (except a single station dc supply that is both monitored and reported at a Control Center for both low voltage ~~(#27 & 59), directional (#32, & 67), and tripping (#86, & 94).~~and open circuit shall not be considered non-redundant);
    d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices, required for Normal Clearing (except a single trip coil that is both monitored and reported at a Control Center shall not be considered non-redundant).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:

   a. System Load level and estimated annual hours of exposure at or above that Load level
   b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:
   a. The estimated number and type of customers affected
   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)

2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

~~C. Measures~~

~~M2.~~ ~~Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.~~

~~M3.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.~~

~~M4.~~ ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.~~

~~M5.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.~~

~~M6.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.~~

~~M7.~~ ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.~~

~~M8.~~ ~~Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.~~

~~M9.~~M1. ~~Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment~~

~~results within 90 calendar days of receipt of those comments in accordance with Requirement R8.~~

~~D. Compliance~~

~~1. Compliance Monitoring Process~~

~~1.1 Compliance Enforcement Authority~~

~~Regional Entity~~

~~1.2 Compliance Monitoring Period and Reset Timeframe~~

~~Not applicable.~~

~~1.3 Compliance Monitoring and Enforcement Processes:~~

- ~~Compliance Audits~~
- ~~Self-Certifications~~

~~Spot Checking~~

- ~~Compliance Violation Investigations~~

~~Self-Reporting~~

- ~~Complaints~~

~~1.4 Data Retention~~

~~The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

- ~~The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.~~
- ~~The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.~~
- ~~The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.~~

~~The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.~~

- ~~The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.~~
- ~~The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.~~
- ~~The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.~~

~~The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

- ~~Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.~~

~~If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.~~

~~1.5 Additional Compliance Information~~

~~None~~

2. ~~Violation Severity Levels~~

	~~Lower VSL~~	~~Moderate VSL~~	~~High VSL~~	~~Severe VSL~~
~~R1~~	~~The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.~~	~~The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.~~	~~The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.~~	~~The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6.~~ ~~OR~~ ~~The responsible entity's System model did not represent projected System conditions as described in Requirement R1.~~ ~~OR~~ ~~The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.~~
~~R2~~	~~The responsible entity failed to comply with Requirement R2, Part 2.6.~~	~~The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.~~	~~The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.~~	~~The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7.~~ ~~OR~~ ~~The responsible entity does not have a completed annual Planning Assessment.~~
~~R3~~	~~The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.~~	~~The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.~~	~~The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of~~	~~The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.~~

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fourth draft of the proposed standard.

Completed Actions	Date
Standards Committee authorized Standard Authorization Request (SAR) for posting	October 29, 2015
SAR posted for comment	May 26 – June 24, 2016
Informal comment period	April 25 – May 24, 2017
45-day formal comment period with initial ballot	September 8 – October 23, 2017
45-day formal comment period with initial ballot	February 23 – April 23, 2018

Anticipated Actions	Date
45-day formal comment period with additional ballot	July 2018
10-day final ballot	October 2018
Board adoption	November 2018

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

Upon Board adoption, the rationale boxes will be moved to the Supplemental Material Section.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**
2. **Number:** **TPL-001-5**
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

~~**1.1.2.** Known outage(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum:~~

~~**1.1.2.1.** Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with the selected known outage(s); and~~

~~**1.1.2.2.** Does not exclude known outage(s) solely based upon the outage duration.~~

~~**1.1.3.**~~**1.1.2.** New planned Facilities and changes to existing Facilities.

~~**1.1.4.**~~**1.1.3.** Real and reactive Load forecasts.

~~1.1.5.~~1.1.4. Known commitments for Firm Transmission Service and Interchange.

~~1.1.6.~~1.1.5. Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within ~~their~~ its respective area, using data consistent with MOD-032 including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

~~**2.1.3.** P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.~~

~~2.1.4.~~2.1.3. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning coordinator or Transmission Planners's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. The analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

~~**2.4.3.** P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.~~

~~**2.4.4.**~~**2.4.3.** For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.~~4~~3 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.

- Installation, modification, or removal of Protection Systems or Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1~~,~~ that are expected to produce more severe System impacts on its portion of the BES~~,~~ shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. ~~If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.~~

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an

evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information:

None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.5~~6~~.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.5~~6~~.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.5~~6~~.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.5~~6~~. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-032 standards and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to “0.1”	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR	

Version	Date	Action	Change Tracking
		proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote ‘b’ in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Version	Date	Action	Change Tracking

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability ~~(P0 through P8 events)~~: a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only ~~(P0 through P7 events only)~~:** f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only ~~(P1 through P7 events only)~~:** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker[10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer[5] 3. Shunt Device[6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes
~~**P8**~~ ~~Multiple Contingency~~ ~~*(Fault plus non-redundant component of a Protection System failure to operate)*~~	~~Normal System~~	~~Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following:~~ ~~1. Generator~~ ~~2. Transmission Circuit~~ ~~3. Transformer [5]~~ ~~4. Shunt Device [6]~~ ~~5. Bus Section~~	~~3Ø~~	~~EHV, HV~~	~~Yes~~	~~Yes~~

<table>
<tr><th colspan="2">Table 1 – Steady State & Stability Performance Extreme Events</th></tr>
<tr><td colspan="2">Steady State & Stability
For all extreme events evaluated:
a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
b. Simulate Normal Clearing unless otherwise specified.</td></tr>
<tr><td>Steady State
1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
a. Loss of a tower line with three or more circuits.[11]
b. Loss of all Transmission lines on a common Right-of-Way[11].
c. Loss of a switching station or substation (loss of one voltage level plus transformers).
d. Loss of all generating units at a generating station.
e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
a. Loss of two generating stations resulting from conditions such as:
i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.</td>
<td>Stability
1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
a. 3Ø fault on generator with stuck breaker[10] resulting in Delayed Fault Clearing.
b. 3Ø fault on Transmission circuit with stuck breaker[10] resulting in Delayed Fault Clearing.
c. 3Ø fault on transformer with stuck breaker[10] resulting in Delayed Fault Clearing.
d. 3Ø fault on bus section with stuck breaker[10] resulting in Delayed Fault Clearing.
e. 3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.
f. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.</td></tr>
</table>

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	g. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. ~~d.~~h. 3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. ~~e.~~i. 3Ø internal breaker fault. ~~f.~~j. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled ‘Initial Condition’) and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows: a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (except a single communication system that is both ~~which is not~~ monitored ~~or not~~ and reported at a Control Center shall not be considered non-redundant); c. A single station dc supply associated with protective functions required for Normal Clearing, ~~and that~~(except a single station dc supply that is ~~not~~ both monitored ~~or not~~and reported at a Control Center for both low voltage and open circuit shall not be considered non-redundant); d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except a single trip coil that is both monitored and reported at a Control Center shall not be considered non-redundant).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:

   a. The estimated number and type of customers affected
   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

<u>III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required</u>

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any

Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2015-10 Single Points of Failure
Reliability Standard TPL-001-5

Applicable Standard(s)

- TPL-001-5 – Transmission System Planning Performance Requirements

Requested Retirement(s)

- TPL-001-4 – Transmission System Planning Performance Requirements

Prerequisite Standard(s)

None

Applicable Entities

- Planning Coordinator
- Transmission Planner

Background

Reliability Standard TPL-001-5 revises the prior version of the TPL-001 standard in three key respects:

- To address reliability issues concerning the study of single points of failure in Protection Systems, as identified in:
  - Federal Energy Regulatory Commission (FERC) Order No. 754, issued on September 15, 2011; and
  - the report dated September 2015 by two subcommittees under NERC Planning Committee , the System Protection and Control Subcommittee and System Analysis and Modeling Subcommittee, titled *Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request;*
- To address directives from FERC Order No. 786 (October 17, 2013) approving Reliability Standard TPL-001-4, relating to:
  - modeling known outages with a duration of less than six months (paragraph 40); and
  - adding stability analysis for the outage of major Transmission equipment with a lead time of one year or more (paragraph 89); and;
- To replace references to the Reliability Standards MOD-010 and MOD-012, which have been superseded by MOD-032.

General Considerations

The standard will become effective 36 months following regulatory approval. The 36-month period provides time for Planning Coordinators and Transmission Planners to develop, among other things:

- A procedure or technical rationale for selecting known outages of generation and Transmission Facilities;
- Coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis required by the standard; and
- Additional analysis required due to changes in the standard.

Following this 36 month period, an additional 24-month period allows time for the development of Corrective Action Plans (CAPs) under TPL-001-5 for Category P5 planning events involving single points of failure in Protection Systems.

Transmission Planners and Planning Coordinators shall have an additional 48 months beyond the time by which CAPs must be developed to comply with the bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1**" for P5 planning events for non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d.

This implementation plan reflects consideration that Planning Coordinators and Transmission Planners will need time to conduct the new studies and analyses in order to coordinate with asset owners and protection engineers to identify appropriate CAP actions and establish the associated timetables for completion. This includes any necessary CAP(s) to address System performance issues for studies involving Table 1 Category P5 (Fault plus non-redundant component of a Protection System failure to operate) required by TPL-001-5 Requirement R2, Part 2.7 for the non-redundant components of a Protection System identified in TPL-001-5 Table 1 Footnote 13.

Please see Figure 1 Implementation Timeline below for an illustration of the 108-month implementation timeline in those jurisdictions where governmental approval is required.

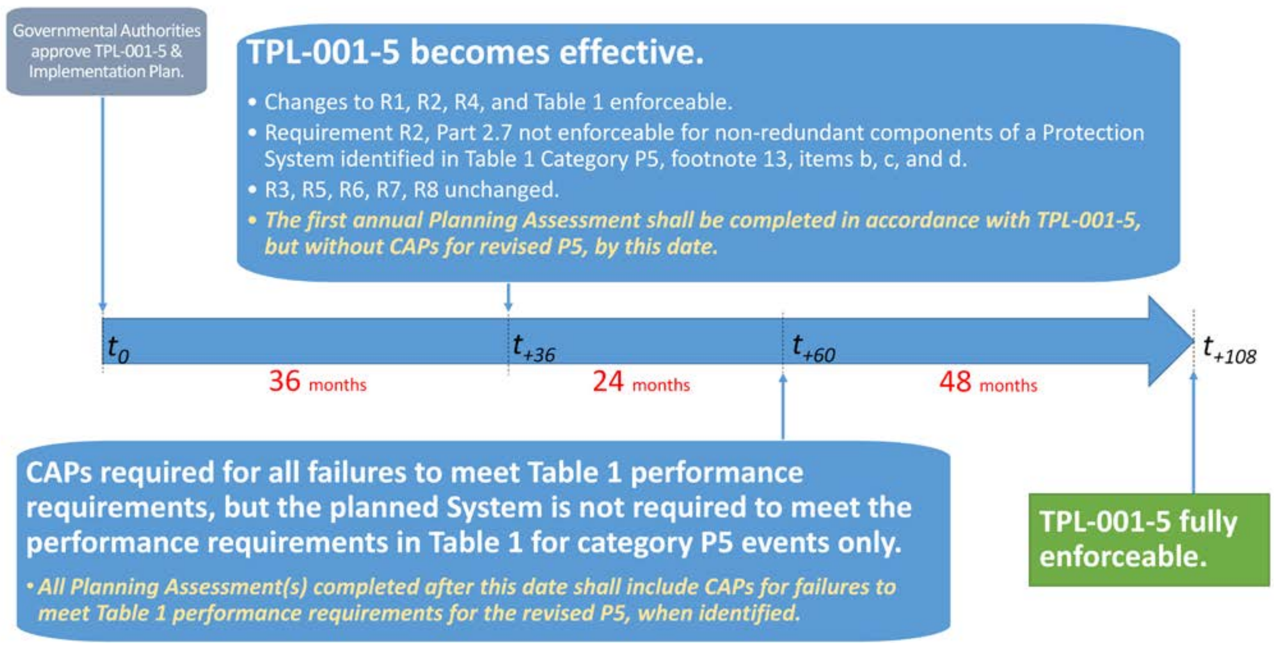

Figure 1 Implementation Plan Timeline

Effective Date

TPL-001-5 – Transmission System Planning Performance Requirements

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for TPL-001-5 Requirement 2, Part 2.7 associated with Table 1 Category P5 Footnote 13 items a, b, c, and d

Entities shall not be required to comply with Requirement R2, Part 2.7 for the Table 1 Category P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d until 24 months after the effective date of Reliability Standard TPL-001-5.

For CAPs developed to address failures to meet Table 1 performance requirements for the P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d, entities shall not be required to comply until 72 months after the effective date of Reliability Standard TPL-001-5 with the bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1.**"

Initial Performance of Periodic Requirements

Each responsible entity shall complete the first annual Planning Assessment in accordance with TPL-001-5 (without CAP(s) for the revised P5 planning event) by the effective date of the standard.

Each responsible entity shall develop any required CAP(s) under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13 items a, b, c, and d by 24 months after the effective date of the standard.

Retirement Date

TPL-001-4 – Transmission System Planning Performance Requirements

Reliability Standard TPL-001-4 shall be retired immediately prior to the effective date of TPL-001-5 in the particular jurisdiction in which the revised standard is becoming effective.

Background

Reliability Standard TPL-001-5 revises the prior version of the TPL-001 standard in three key respects:

- To address reliability issues concerning the study of single points of failure ~~on~~in Protection Systems, as identified in~~ ~~:
    - Federal Energy Regulatory Commission (FERC) Order No. 754, issued on September 15, 2011~~,~~; and
    - the report dated September 2015 by two subcommittees under NERC Planning Committee , the System Protection and Control Subcommittee and System Analysis and Modeling Subcommittee~~ September 2015 report~~, titled *Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request;*
- To address directives from FERC Order No. 786 ~~issued ~~(October 17, 2013~~, in which FERC approved~~) approving Reliability Standard TPL-001-4, relating to:
    - modeling known outages with a duration of less than six months~~;~~ (paragraph 40); and
    - adding stability analysis for the outage of major Transmission ~~E~~equipment with a lead time of one year or more~~.~~ (paragraph 89); and;
- To replace references to the Reliability Standards MOD-010 and MOD-012~~ standards~~, which have been superseded by ~~the ~~MOD-032~~ Reliability Standard~~.

General Considerations

~~This implementation plan provides 36 months until the~~The standard will become effective ~~date of the Standard, providing~~36 months following regulatory approval. The 36-month period provides time for Planning Coordinators and Transmission Planners ~~with time to update their annual Planning Assessments to include the new System models and studies required by the standard. This implementation period reflects consideration that Planning Coordinators and Transmission Planners will need time~~ to develop, among other things:

- A procedure or technical rationale for selecting known outages of generation and Transmission Facilities;
- ~~A process for establishing coordination~~Coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis required by the standard; and
- Additional ~~base case models and~~ analysis~~.~~ required due to changes in the standard.

~~In addition,~~
Following this ~~implementation plan includes~~36 month period, an additional 24-month period allows time for the development of Corrective Action Plans (CAPs) under TPL-001-5 ~~to address newly-added studies~~ for Category P5~~ and P8~~ planning events involving single points of failure ~~on~~in Protection Systems.

~~This extended implementation period for the~~Transmission Planners and Planning Coordinators shall have an additional 48 months beyond the time by which CAPs must be developed to comply with the bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1**"~~, acknowledges that failures to meet System performance requirements, identified during subsequent Planning Assessment(s), for single points of failure in Protection Systems may not be mitigated by an Operating Procedure during an interim period before a mitigating capital improvement is installed~~" for P5 planning events for non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d.

This implementation ~~period~~plan reflects consideration that Planning Coordinators and Transmission Planners will need time ~~beyond that provided~~ to conduct the new studies and ~~analysis~~analyses in order to ~~develop processes for coordination~~coordinate with asset owners and protection engineers to identify appropriate CAP actions and establish the associated timetables for completion. This includes any necessary CAP(s) to address System performance issues for studies involving Table 1 Category P5~~ and P8 Multiple Contingency~~ (Fault plus non-redundant component of a Protection System failure to operate) required by TPL-001-5 Requirement R2, Part 2.7 for the non-redundant components of a Protection System identified in TPL-001-5 Table 1 Footnote 13.

~~Lastly, the provisions related to CAP including Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3) are carried forward from the TPL-001-4 implementation plan.~~
Please see Figure 1 Implementation Timeline below for an illustration of the 108-month implementation timeline in those jurisdictions where governmental approval is required.

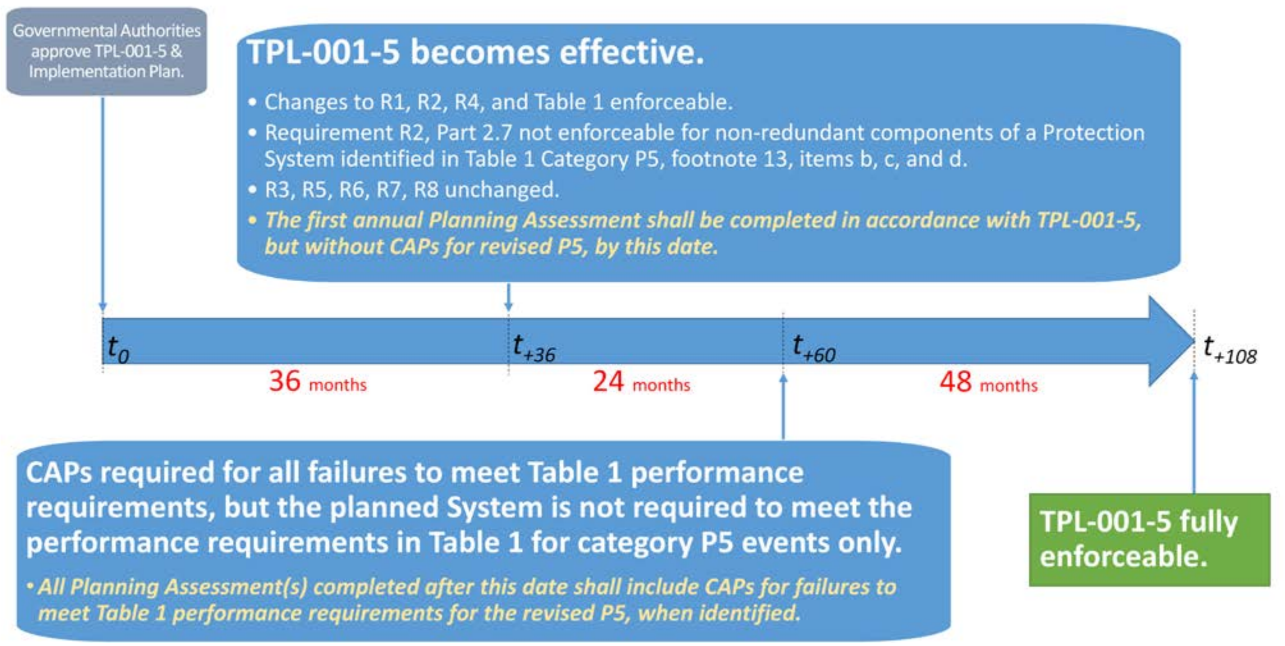

Figure 1 Implementation Plan Timeline

Effective Date

TPL-001-5 – Transmission System Planning Performance Requirements

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for TPL-001-5 Requirement 2, Part 2.7 associated with Table 1 Category P5 Footnote 13 items a, b, c, and d ~~and P8~~

Entit~~l~~ies shall not be required to comply with Requirement R2, Part 2.7 for the Table 1 Category P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d ~~or P8~~ until 24 months after the effective date of Reliability Standard TPL-001-5.

For CAPs developed to address failures to meet Table 1 performance requirements for ~~P5 or P8 events only, Transmission Planners~~the P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and ~~Planning Coordinators~~d, entities shall not be required to comply until 72 months after the effective date of Reliability Standard TPL-001-5 with the ~~section~~bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall**

continue to meet the performance requirements in Table 1~~", until 96 months after the effective date of Reliability Standard TPL-001-5.~~."

~~**Note Regarding CAPs**~~
~~For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval of TPL-001-4, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, CAP applying to the following categories of Contingencies and events identified in TPL-001-5, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-5:~~

- ~~P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P2-1~~
- ~~P2-2 (above 300 kV)~~
- ~~P2-3 (above 300 kV)~~
- ~~P3-1 through P3-5~~
- ~~P4-1 through P4-5 (above 300 kV)~~
- ~~P5 (above 300 kV)~~

Initial Performance of Periodic Requirements

Each responsible entity shall complete the first annual Planning Assessment ~~without CAPs for revised P5 or P8~~ in accordance with TPL-001-5 (without CAP(s) for the revised P5 planning event) by the effective date of the standard.

Each responsible entity shall develop any required CAP(s) under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13 items a, b, c, and d ~~and P8~~ by 24 months after the effective date of ~~Reliability Standard TPL-001-5~~the standard.

Retirement Date

TPL-001-4 – Transmission System Planning Performance Requirements

Reliability Standard TPL-001-4 shall be retired immediately prior to the effective date of TPL-001-5 in the particular jurisdiction in which the revised standard is becoming effective.

Unofficial Comment Form

Project 2015-10 Single Points of Failure TPL-001

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2015-10 TPL-001-5 – Transmission System Planning Performance Requirements** by **8 p.m. Eastern, Tuesday, September 11, 2018.**

Additional information is available on the project page. If you have questions, contact Standards Developer, Latrice Harkness (via email), or at (404) 446-9728.

Background Information

The SPCS and the SAMS conducted an assessment of protection system single points of failure in response to FERC Order No. 754, including analysis of data from the NERC Section 1600 Request for Data or Information. The assessment confirms the existence of a reliability risk associated with single points of failure in protection systems that warrants further action**.**

Additionally, the two directives from FERC Order No. 786 (p. 40 and p. 89) and updates to the MOD reference in Requirement R1, Measure M1 and the Violation Severity Levels sections have been added to the scope of the project.

Questions

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree with the removal of Requirement 1, Part 1.1.2 and changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4, in order to meet the FERC directive in Order No. 786?

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree with the proposed revisions to TPL-001-4?

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the proposed implementation plan?

   ☐ Yes
   ☐ No

   Comments:

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 754 and Order No. 786?

   ☐ Yes
   ☐ No

Violation Risk Factor and Violation Severity Level Justifications

Project 2015-10 Single Points of Failure TPL-001

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for Requirement R4 in Project 2015-10 and Single Points of Failure TPL-001. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards

FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for TPL-001-5, Requirement R1

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R1

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R2

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
conditions when known outages are scheduled.	~~Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.~~ 2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning coordinator or Transmission Planners's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has	without Non-Consequential Load Loss, maintain a stable System without Cascading and uncontrolled islanding. (FERC Order 786, Paragraph 41). Therefore, consistent with the principle of TPL-001-5 Requirement R3, Part 3.4 which requires the Transmission Planner and Planning Coordinator to identify those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, only those P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES are to be assessed for System models that include known outages pursuant to Requirement R2, Part 2.1.4.

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1	
TPL-001-4, Requirement R2 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance: • Load level, Load forecast, or dynamic Load model assumptions. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios.	TPL-001-5, Requirement R2 2.4.43. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance: • Load level, Load forecast, or dynamic Load model assumptions. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios.	Requirement R2, Part 2.4.3 has been moved back to 2.4.3 as it was in TPL-001-4.

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	TPL-001-5, Requirement R2 ~~2.4.3. P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.~~ 2.4.~~3~~4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System	TPL-001-5, Requirement R2, Part 2.4.4 TPL-001-4, Part 2.4.3 moved to TPL-001-5, Part 2.4.4 Modified the standard to add a Stability analysis requirement for P1 events in Table 1, with known outages under appropriate System conditions, that includes similar language to that used for the steady state analysis stated in Requirement R2, Part 2.1.4. For reasons similar to those justifying changes to Requirement R2 Part 2.1.4, the Transmission Planner and Planning Coordinator shall identify those P1 events in Table 1 expected to produce more severe System impacts on its portion of the BES to be assessed for System models that include known outages pursuant to Requirement R2 Part 2.4.4.

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.	
	TPL-001-5, Requirement R2 **2.4.5.** When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.	TPL-001-5, Requirement R2, Part 2.4.5 Consistent with FERC Order 786 Para 89, modified the standard to add Requirement R2, Part 2.4.5, which includes similar language to that used for the steady-state analysis stated in Requirement R2, Part 2.1.5 to address stability analysis for spare equipment strategy.

Standard: TPL-001-5		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
TPL-001-4, Requirement R2 Requirement R2 Part 2.7 **2.7** For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:	TPL-001-5, Requirement R2 Requirement R2 Part 2.7 **2.7** For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.~~4~~3 and 2.4.3. The Corrective Action Plan(s) shall:	TPL-001-5, Requirement R2, Part 2.4.5 Requirement R2, Part 2.7 Changed Requirement subpart reference in Requirement 2, Part R2.7 in standard.

Preface

The vision for the Electric Reliability Organization (ERO) Enterprise, which is comprised of the North American Electric Reliability Corporation (NERC) and the seven Regional Entities (REs), is a highly reliable and secure North American bulk power system (BPS). Our mission is to assure the effective and efficient reduction of risks to the reliability and security of the grid.

The North American BPS is divided into seven RE boundaries as shown in the map and corresponding table below. The multicolored area denotes overlap as some load-serving entities participate in one Region while associated Transmission Owners/Operators participate in another.

WECC	Western Electricity Coordinating Council

Executive Summary

Project 2015-10 Technical Rationale provides the background and rationale for proposed revisions to Reliability Standard TPL-001-4. The proposed revisions address reliability issues concerning the study of single points of failure (SPF) on Protection Systems from FERC Order No. 754, directives from FERC Order No. 786 regarding planned maintenance outages and stability analysis for spare equipment strategy , and replaces references to the MOD-010 and MOD-012 standards with the MOD-032 Reliability Standard.

Key Concepts of FERC Order No. 754

The Standard Drafting Team (SDT) took into account the recommendations for modifying NERC Reliability Standard TPL-001-4 identified in both the SPCS and SAMS report titled *Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request* and the *Informational Filing of the North American Electric Reliability Corporation in Response to Order No. 754* to the FERC. In "Table 1 – Steady State and Stability Performance Planning Events," the Category P5 event incorporates Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System. In "Table 1 – Steady State and Stability Performance Extreme Events," breaker failure and failure of a non-redundant component of a Protection System are differentiated. The SDT recognizes that sequence and timing of Protection System action leading to Delayed Clearing may be quite different between the two causalities, and also that fault severity and acceptable consequence of failure of a non-redundant component of a Protection System should be differentiated. Footnote 13 of the "Table 1 – Steady State & Stability Performance Footnotes" describes the non-redundant Protection System components to be considered for Category P5 Planning Events and Stability Extreme Events.

Key Concepts of FERC Order No. 786

The SDT considered the Commission's concern that the outages of significant facilities less than six months could be overlooked for planning purposes, that Category P3 and P6 do not sufficiently cover planned maintenance outages, and the Near-Term Transmission Planning Horizon requires annual assessments using Year One or year two, and year five, and known planned facility outages of less than six months should be addressed so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon. Proposed revisions remove the six month outage duration, shift the consideration of known outages from Requirement R1, which requires what System models shall represent, to Requirement R2, Parts 2.1 and 2.4, which require the study and assessment of known outages. Further, proposed revisions include a requirement to document an outage coordination procedure or the technical rationale for the determination of which known outages to study. Proposed revisions also included the addition of stability assessment for long lead equipment that does not have a spare.

Summary of proposed revisions

- Requirement R1 – Updated for MOD-032-1 standard.
- Requirement R1, Part 1.1.2 – Removed this requirement.
- Requirement R2, Part 2.1.4 – Added model conditions for steady state analysis of P0 and P1 events for known outages.
- Requirement R2, Part 2.4.4 – Added model conditions for stability analysis of P1 events for known outages.
- Requirement R2, Part 2.4.5 – Added stability analysis requirement for long lead time equipment unavailability.
- Requirement R3, Part 3.2 – Document internal conforming clean-up to incorporate the last sentence of Part 3.5.

- Requirement R4, Part 4.2 – Document internal conforming clean-up to incorporate the last sentence of Part 4.5.
- Table 1 – Modified Category P5 event to include SPF.
- Table 1 – Modified Extreme Events, Stability column to differentiate SPF from stuck breaker.
- Table 1 – Modified Footnote 13 to specify the SPF that should be considered.

Introduction

NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) is being modified to address reliability issues and standard modification directives contained in FERC Order No. 754[1] and FERC Order No. 786.[2] Proposed Reliability Standard TPL-001-5 revises the TPL-001 standard to address the reliability risks posed by SPF on Protection Systems.

Background

FERC Order No. 754

FERC Order No. 754 directed NERC to study the reliability risk associated with SPF in Protection Systems. As a follow-up to a NERC Technical Conference where the risks and concerns associated with SPF were discussed, the NERC System Protection and Control Subcommittee (SPCS) and the System Analysis and Modelling Subcommittee (SAMS) conducted an assessment of Protection System SPF in response to FERC Order No. 754, including analysis of data collected pursuant to a request for data or information under Section 1600 of the NERC Rules of Procedure. The SPCS and SAMS report titled *Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request* and the *Informational filing of the North American Electric Reliability Corporation in Response to Order No. 754* to the FERC provide extensive general discussion about the reliability risks associated with a SPF.

The SDT strongly considered the recommendations of the SPCS and SAMS report, recognizing that the purpose of that report was to determine whether a reliability concern existed demanding NERC to address the study of SPF on Protection Systems. The formation of the Project 2015-10 directly resulted from the SPCS and SAMS report recommendations. However, the SDT's obligation was to consider the reported recommendations and translate them into proposed TPL-001-5 Reliability Standard requirements that are meaningful to Planning Coordinators and Transmission Planners for performance of annual TPL Planning Assessments which adequately account for the reliability risk posed by SPF on Protection Systems.

FERC Order No. 786

In FERC Order No. 786, FERC directed NERC to address two issues. The first issue is the concern that the six month outage duration threshold could exclude planned maintenance outages of significant facilities from future planning assessments. FERC directed NERC to modify TPL-001-4 to address this concern. The second issue involves adding clarity regarding dynamic assessment of outages of critical long lead time equipment, consistent with the entity's spare equipment strategy. FERC directed NERC to consider this issue upon its next review of TPL-001-4. The NERC SAMS developed a white paper documenting the technical analysis conducted by SAMS to address the two directives contained in the FERC Order No. 786. The white paper provides extensive general discussion regarding the directives.

Section 1: Single Points of Failure on Protection Systems (FERC Order No. 754)

NERC Advisory

On March 30, 2009, NERC issued an advisory[3] report notifying the industry that a SPF issue had caused three significant system disturbances in 5 years.

Transmission Owners, Generation Owners, and Distribution Providers owning Protection Systems installed on the Bulk Electric System (BES) were advised to address SPF on their Protection Systems when identified in routine system evaluations to prevent N-1 transmission system contingencies from evolving into more severe or even extreme events.

These entities were additionally advised to begin preparing an estimate of the resource commitment required to review, re-engineer, and develop a workable outage and construction schedule to address SPF on their Protection Systems.

FERC Order No. 754

In FERC Order No. 754 Paragraph 20, FERC directed NERC to "to make an informational filing within six months of the date of the issuance of this Final Rule explaining whether there is a further system protection issue that needs to be addressed and, if so, what forum and process should be used to address that issue and what priority it should be accorded relative to other reliability initiatives planned by NERC."

FERC Technical Conference

A FERC technical conference concerning the Commission's Order 754 titled Staff Meeting on Single Points of Failure on Protection Systems was held on October 24-25, 2011 at FERC in Washington, DC.

At the technical conference, the attendees discussed the SPF issue and narrowed their concerns into four consensus points:

- The concern with assessment of SPF is a performance-based issue, not a full redundancy issue.
- The existing approved standards address assessments of SPF.
- Assessments of SPF of non-redundant primary protection (including backup) systems need to be sufficiently comprehensive.
- Lack of sufficiently comprehensive assessments of non-redundant primary Protection Systems is a reliability concern.

Joint SPCS-SAMS Report

One outcome of the FERC technical conference was that NERC would conduct a data collection effort to provide a broad factual foundation that could aid in assessing the reliability risks posed by SPF. The NERC Board of Trustees approved the request for data or information under Section 1600 of the NERC Rules of Procedure ("Order No. 754 Data Request") on August 16, 2012.

In September 2015, SPCS and SAMS issued a report to the NERC Planning Committee (PC) and Operating Committee (OC), summarizing the information collected under the Order No. 754 Data Request. The assessment confirmed the existence of a reliability risk associated with SPF in Protection Systems that warrants further action.

[3] *See* *Industry Advisory: Single Point of Failure*
http://www.nerc.com/files/Final_Order_754_Informational_Filing_3-15-12_complete.pdf

To address this risk, the SPCS and the SAMS considered a variety of alternatives and concluded that the most appropriate recommendation that aligns with FERC Order No. 754 directives and maximizes reliability of Protection System performance is to modify NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) through the NERC standards development process.

The SDT strongly considered the recommendations of the SPCS and SAMS report, as specified by the Project 2015-10 Single Points of Failure Standards Authorization Request (SAR). The SDT recognized that its obligation was to consider the reported recommendations and translate them into proposed TPL-001-5 Reliability Standard requirements that are meaningful to Planning Coordinators and Transmission Planners for performance of annual TPL Planning Assessments. The SPCS and SAMS report recommendations, as well as how they have been addressed in proposed TPL-001-5 by the Project 2015-10 SDT are summarized in the following section.

Revisions to TPL-001-4

Single Points of Failure – Category P5 Planning Events

The SPCS and SAMS report states, "Analysis of the data demonstrates the existence of a reliability risk associated with single points of failure in protection systems that warrants further action. The analysis shows that the risk from single point of failure is not an endemic problem and instances of single point of failure exposure are lower on higher voltage systems. However, the risk is sufficient to warrant further action. Risk-based assessment should be used to identify protection systems of concern (i.e., locations on the BES where there is a susceptibility to cascading if a protection system single point of failure exists)".

The modifications to the Category P5 Planning event description are intended to be aligned with the changes to the Table 1, Footnote 13. The SDT has modified Table 1, Footnote 13 to capture the SAMS/SPCS recommendations for Category P5 events, which expands beyond the previously limited set of relays identified in TPL-001-4, to capture the identified SPF of concern. Footnote 13 describes the non-redundant Protection System components to be considered for Category P5 Planning Events, and is discussed further below.

The Table 1 Category P5 event describes a Contingency where a single line-to-ground (SLG) fault occurs and Delayed Fault Clearing results due to the failure of the Protection System, protecting the Faulted element, to operate as designed. Typically, the two most important aspects of the P5 event that affect simulation are the magnitude of SLG fault current and the mode of Protection System failure leading to Delayed Clearing. The latter is especially important and the mode of Protection System failure details make the P5 event unique. The Transmission Planner or Planning Coordinator must be cognizant of the time period during which the Protection System removes Elements from service, as well as the sequence of their removal during isolation of the fault. By definition, Normal Clearing is not expected when a non-redundant component of a Protection System is simulated to have failed; the P5 event implies that the Protection System does not operate as designed to clear the SLG fault in the time normally expected with proper functioning of the installed Protection System. Therefore, when a non-redundant component of a Protection System fails, Delayed Clearing results. This means that correct operation of the backup Protection System occurs with the intentionally designed time delay before fault clearing. Additionally, there may be significant differences in final System configuration due to the Protection System operation to clear the faulted Element. For example, more System Elements may be removed from service when the backup Protection System operates, consistent with Delayed Clearing, than may be expected during primary Protection System operation expected for Normal Clearing. The expected time delays for Protection System operation are critical for proper simulation of the P5 event.

It is anticipated that the most cost-effective Corrective Action Plans to address unacceptable system performance for the P5 Planning Events will likely be to add Protection System component redundancy, consistent with the components to be considered in Footnote 13. Protection System redundancy changes to address Category P5 Event concerns should also reduce or even negate non-redundant components that need to be considered in assessing System performance resulting from simulation of the 2e-2h Extreme Events; hence, potentially mitigating many concerns.

Clarification: Why address SPF in TPL-001 and not create a new Reliability Standard for this purpose?

As part of the recommendations from the SPCS and SAMS report, the option to create a new Reliability Standard to address SPF in the Protection System was considered. Both a new TPL standard for planning-related studies and assessment, as well as a new Protection and Control standard to specify Protection System redundancy were debated by SPCS and SAMS. Ultimately, the recommendation of the SPCS and SAMS report, leading to the formation of the Project 2015-10 SDT, focused upon the simulation and study assessment of the Transmission system given non-redundant components of the Protection System instead of mandating a level of redundancy across a diverse set of equipment and utilities in North America.

It is important to emphasize that modifications to the TPL-001-5 Table 1 Category P5 Planning Event, the TPL-001-5 Table 1 Extreme Stability Events, and related changes to Table 1, Footnote 13 do not establish or mandate a level of redundancy for Protection Systems. Quite the contrary: the modifications presented in TPL-001-5 require planning entities to consider the non-redundant components of Protection Systems that may exist within their respective Systems, to execute appropriate studies, and to assess the impacts that these SPF may have upon the ability to meet Table 1 System performance requirements given Delayed Clearing. TPL-001-5 does not mandate redundancy; TPL-001-5 requires that some non-redundancy components of a Protection System be considered during annual Planning Assessments.

Clarification: What is the difference between a top-down versus bottom-up approach to Category P5 Events?

As part of simulating and analyzing results of P5 Event assessments, two common approaches to the Stability portion of simulations may be appropriate for planning entities to undertake. The first, referred to as the top-down approach, may initially focus upon determining critical clearing times for an entity's System topology given SLG faults. Once critical clearing times are obtained, the planning entity has the opportunity to collaborate with System Protection personnel to assess whether the installed Protection System may achieve the required performance. An advantage of the top-down approach is that the analytical burden to determine critical clearing times is front-loaded upon the planning entity and specific details regarding the Protection System are unnecessary prior to executing dynamics simulations. Conversely, the bottom-up approach may commence by the planning entity requesting the detailed causality and clearing times for SPF on the Protection System from Protection System personnel, requiring an extensive review of installed Protection Systems at the outset. While this approach may delay the execution of P5 Event studies, it may eliminate System topology that is not susceptible to SPF on the Protection System based upon Protection System personnel input and reduces the planning entity's dynamics simulation burden. Whether utilizing a top-down, bottom-up, combination of the two, or any other appropriate approach, the obligation specified in Table 1, Footnote 13 is for the planning entity to consider the non-redundant components of a Protection System that may lead to Delayed Clearing when simulating the P5 Event.

Clarification: Is backup protection redundant?

The majority of BES Protection Systems are designed with overlapping zonal protection, including backup systems which eventually clear a fault in the event of a failure of the Protection System which is designed for Normal Clearing. Backup Protection Systems are not redundant for purposes of TPL-001-5 Table 1, Category P5 Events because they result in Delayed Clearing and/or trip more Elements than the primary Protection System designed for Normal Clearing. Where the Protection System is designed with backup protections, the backup protection clearing time for a SLG fault must be the same as the clearing time for the primary Protection System designed for Normal Clearing, and must trip identical Elements, in order for the backup Protection System to be considered redundant to the primary Protection System. The SDT expects this type of design to be rare in its implementation, and correspondingly, backup protection is not considered redundant.

Table 1, Footnote 13

Footnote 13 is included in the TPL-001-5 Reliability Standard for the purpose of focusing the Transmission Planner and Planning Coordinator consideration of non-redundant components of a Protection System that may, when they fail, lead to Delayed Clearing of the SLG fault simulated as part of the P5 event.

The SPCS and SAMS report recommended replacing “relay” with “component of a Protection System” in the Table 1 P5 event and replace Footnote 13 in TPL-001-4 with the following alternate wording:

> The components from the definition of ’Protection System‘ for the purposes of this standard include (1) protective relays that respond to electrical quantities, (2) single station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), and (3) DC control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A factor that the SDT considered when seeking to translate the SPCS and SAMS recommendations into the proposed TPL-001-5 Table 1, Footnote 13 was the need for Planning Coordinators and Transmission Planners to collaborate with System Protection personnel. The SDT recognized that the planning entities do not always have enough information alone to consider Protection System modes of failure or Delayed Clearing than may result. Likewise, the SPCS and SAMS recommendations were adapted to target the potential non-redundant components of a Protection System that may likely need System Protection personnel input when determining how study simulations, performed by the planning entity, should be executed. Based on discussion and industry comment, the SDT revised Footnote 13 to clarify the components of the Protection System that must be considered when simulating Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System. This consideration is intended to account for:

- failed non-redundant components of a Protection System that may impact one or more Protection Systems;
- the duration that faults remain energized until Delayed Fault Clearing, and;
- additional system equipment removed from service following fault clearing depending upon the specific failed non-redundant component of a Protection System.

The SPCS and SAMS report described voltage or current sensing devices as having a lower level of risk of failure to trip due to robustness and likelihood to actually cause tripping upon failure. Therefore, these components of a Protection System are omitted from Footnote 13.

Clarification: Why is monitored and reported to a Control Center used in parts of Footnote 13?

The SDT recognized that some components of a Protection System may be monitored and their integrity reported to a Control Center. Different than an indication of a component failure that may be displayed in a remote site or in a location that may go unnoticed for a period, reporting to a Control Center implies that an unsatisfactory condition would be identified and corrective action be directed in short order. Given that a risk-based approach to non-redundant components of a Protection System is appropriate, the SDT believed that components that may be SPF but are monitored and reported to a Control Center exhibited lower risk on par with being redundant, and therefore did not warrant P5 Event simulation.

Clarification: Why are relays that respond to electrical quantities addressed?

Noting that Requirement R3, Part 3.3.1 and Requirement R4, Part 4.3.1 require simulation of Protection System action, the SDT sought to limit the scope of Footnote 13a with respect to protective relays that may be non-redundant components of a Protection System. Specifically, Footnote 13 limits single protective relays that may be a SPF to those which respond to electrical quantities and are used for primary protection resulting in Normal Clearing. A SPF in a single protective relay that is a non-redundant component of a Protection System may result in the primary Protection System failing to properly operate, leading to Delayed Fault Clearing performed by backup protective relays and/or overlapping zonal protection. Conversely, the SDT did not include backup protective relays in the scope of Footnote 13a given that an SPF in a single protective relay used for backup protection will not affect primary protection resulting in Normal Clearing.

The SDT recognized that BES Elements are predominantly protected by relays which respond to electrical quantities. However, in some Protection System designs, non-redundant single protective relays which respond to electrical quantities may be redundant to protective relays that do not respond to electrical quantities. For example, an independent differential relay and independent sudden pressure relay may protect the same transformer from faults inside the transformer tank. In this example, the differential relay responds to electrical quantities, while the sudden pressure relay does not. While the transformer differential relay may be an SPF, an internal transformer tank fault may not lead to Delayed Clearing given the sudden pressure protection, provided, in this example, that the resulting clearing time is similar to that achieved with the differential relay. Subsequently, the P5 event, for a single phase-to-ground (line-to-ground) fault in the transformer tank need not be simulated for Delayed Fault Clearing due to the SPF of the transformer differential relay if the resulting clearing time is similar to that achieved with the differential relay. However, care must be taken when evaluating protective relays which respond to electrical quantities in combination with protective relays which do not respond to electrical quantities; in this same example, faults that occurred outside of the transformer tank given the SPF of the non-redundant transformer differential relay would be unaffected by the presence of the sudden pressure relay and would lead to delayed clearing, necessitating its assessment as a P5 event (See Figure 1 and 2).

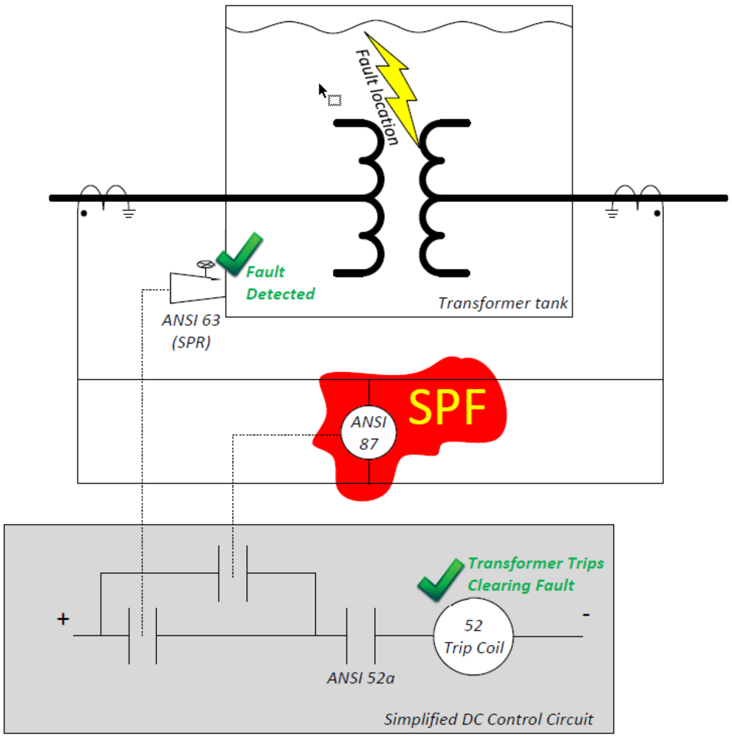

Figure 1: Internal Transformer Tank Fault with Sudden Pressure Protection and failed Transformer Differential Relay

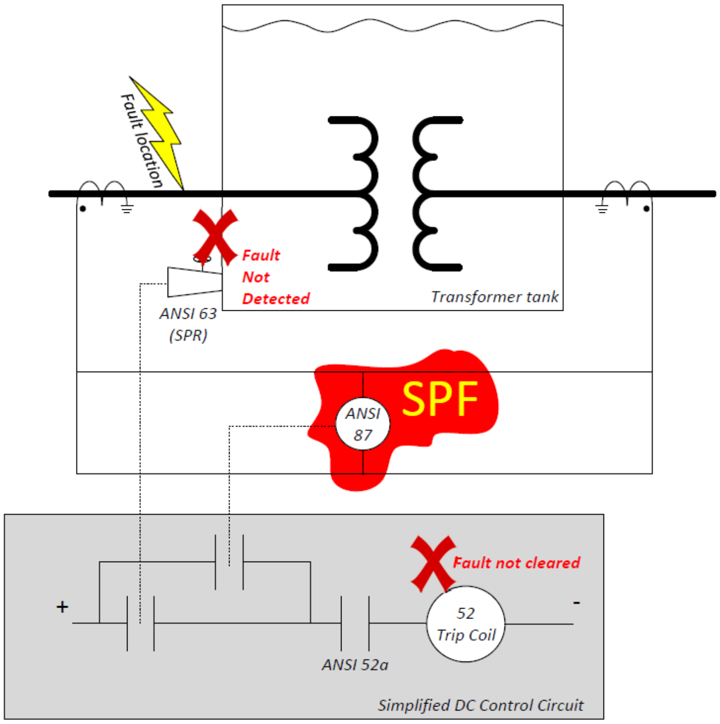

Figure 2: External Transformer Tank Fault with Sudden Pressure Protection and failed Transformer Differential Relay

Clarification: What is comparable and what is not comparable for purposes of footnote 13?

The use of "comparable" in Table 1, Footnote 13a applies only to alternatives for a single protective relay that responds to electrical quantities. For an alternative to be comparable to a single protective relay that responds to electrical quantities, the alternative must operate as designed to clear the fault within the time period expected if the single protective relay (that is simulated to fail as a SPF) were to function properly. Clearly, any alternative to a single protective relay that responds to electrical quantities may result in a different Element tripping sequence, leading to a different System topology after fault clearing which must be considered. Therefore, a comparable alternative to a single protective relay that responds to electrical quantities must result in fault clearing within the expected Normal Clearing time period and isolate the fault by tripping similar System Elements.

Clarification: Why are communication-aided Protection Systems addressed?

Given the increasing importance of communication-aided Protection Systems (e.g., pilot protection schemes, direct transfer tripping schemes, permissive transfer tripping schemes, line differential relaying schemes, etc.), the proper operation of the communication system must be considered when considering potential SPF components of Protection Systems. The SDT augmented the SAMS/SPCS recommendations to include reference to the subset of communication systems that are part of a communication-aided Protection System, necessary where the performance of that Protection System is required to achieve Transmission System Planning (TPL) Performance Requirements, enumerated in Table 1 of TPL-001-4. In other words, a communication-aided Protection System that may experience an SPF, causing it to operate improperly or not at all, must be considered as part of non-redundancy. The SDT concluded that, although the failure of communication-aided Protection Systems may take many forms, by monitoring and reporting the status of these systems, the overall risk of impact to the BES can potentially be reduced to an acceptable level. However, monitoring and reporting the status of these systems can only really be considered as a sufficient alternative to physical redundancy if the result is prompt notification and remediation which minimizes the exposure to and consequence of this failed component. Most new Protection Systems deployed in the industry include communication-aided protection with component and communication failure alarms monitored at centralized Control Centers. Therefore, this requirement is more applicable to legacy systems that need communication-aided Protection Systems to meet performance requirements of the TPL standards.

Clarification: Why are DC supplies addressed?

The SDT adopted the fundamental principles of the SAMS/SPCS recommendations regarding station Protection System DC supply. Failure of a single station Protection System DC supply is a significant point of failure as it will prevent the operation of all local protection, including back-up protection. The SDT partly modified the SAMS/SPCS recommendation regarding single station DC supply, including removal of the specific requirement that reporting the detection of an abnormal condition to a location where corrective action can be initiated must occur within 24 hrs. This modification recognizes the wide variety of reporting and monitoring that exists. However, it remains the intention of Footnote 13c, that monitoring and reporting the status of the DC supply can only really be considered as a sufficient alternative to physical redundancy if the result is prompt notification and remediation which minimizes the exposure to and consequence of DC supply failure. Similar to as noted with communication-aided Protection Systems, most new Protection Systems include DC supply status alarms which are monitored at centralized Control Centers; however, they may not necessarily be monitored for both low voltage and open circuit Therefore, this requirement may be more applicable to legacy systems.

Clarification: What differentiates a single station DC supply (Footnote 13c) from a single control circuitry (Footnote 13d)?

The station DC supply includes station battery, battery chargers and non-battery-based dc supply, as enumerated in the NERC Glossary of Terms definition of Protection System. The control circuitry includes everything from where the station DC supply terminates through and including the trip coils, including the wiring, as well as auxiliary and lockout relays. Further, the NERC Technical Paper *"Protection System Reliability Redundancy of Protection System Elements"* (November 2008) shows a demarcation between DC supply and the remainder of DC control circuitry. The SAMS and SPCS report and recommendations align with Figure 5-12 from this technical paper, shown below as Figure 3.

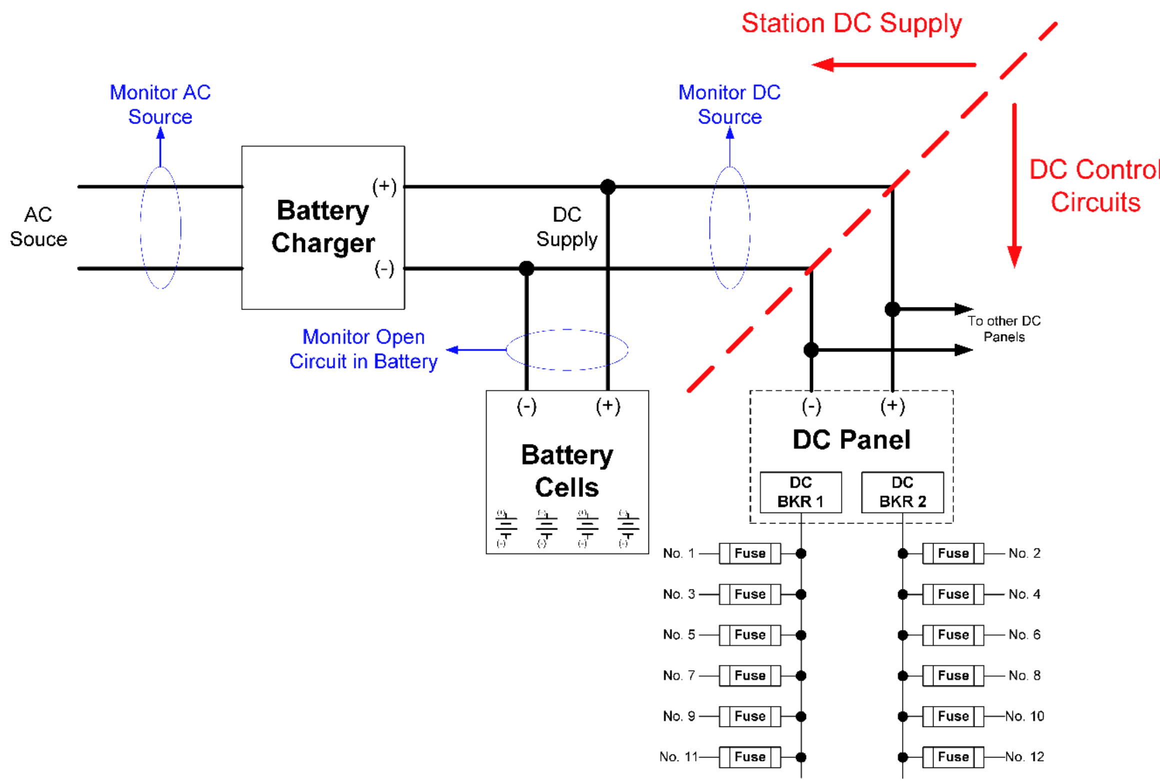

Figure 3 – Station DC supply and monitoring (Figure 5-2, from NERC Technical Paper "Protection System Reliability Redundancy of Protection System Elements", Nov 2008)

Simply monitoring for low voltage on the DC supply may omit situations where the DC supply voltage is satisfactory but the source path to DC control circuits may be open circuited. Thus, monitoring for low voltage and open circuit of the DC supply should be considered. Additionally, while the wiring in both the DC supply and the DC circuit have lower probabilities of failure as compared to other Protection System components, the SPCS and SAMS report identified this as a SPF risk.

Clarification: Is a battery charging system appropriate redundancy for the battery?
Battery chargers may not be of sufficient power to source current necessary to operate one or more breakers. For example, it is unlikely that a battery charger without a station battery in parallel would be capable of opening several breakers when demanded by a bus differential Protection System operation. Therefore, a battery charger cannot take the place of a redundant battery DC supply.

The Distinction between Category P4 and Category P5 Planning Events
"Table 1 – Steady State and Stability Performance Planning Events," makes a clear distinction between breaker failure, Category P4 Planning Events, and failure of a non-redundant component of a Protection System, Category P5 Planning Events. The sequence and timing of Protection System action leading to Delayed Clearing may be quite different between the two fundamentally different causalities. Category P4 events involving the failure specifically of a circuit breaker assume that only the circuit breaker has failed, and that all other protection functions, including proper initiation of local breaker failure operation, has occurred correctly. For Category P5 Planning Events, failure of the various non-redundant components of a Protection System, as enumerated in Table 1, Footnote 13, can result in a relatively broader range of final system states, resulting from the Delayed Clearing associated with the specific SPF, and which may or may not resemble the system states resulting from Delayed

Clearing associated with circuit breaker failure. Likewise, the Delayed Clearing time that results from a Category P5 Event may be significantly longer that that expected when simulating Category P4 Event.

It is noted that there may be many instances where a fault followed by a breaker failure results in the exact same study simulations as a fault followed by a failure of a non-redundant component of a Protection System. There could be slight differences in clearing times and the Planning Coordinator or Transmission Planner may choose to simulate a P4 and P5 as one study using the longest expected clearing time. However**,** in the event of a bus fault followed by a bus differential protection failure, there may be a single relay (ANSI device 86) communicating to several breakers attached to the faulted bus. A bus fault on a breaker and a half configuration or double breaker double bus configuration may be particularly problematic in this case. For the Category P5 Event simulating this type of Protection System failure, none of the breakers which should open to clear the fault will receive the appropriate signal from the failed SPF relay and will not clear the bus fault. This makes the bus differential P5 Event significantly more severe than the P4 Event. The FERC Order 754 Section 1600 Data Request was specific to bus faults followed by a SPF of the Protection System.

In some cases, a P4 Event simulation at a specific location will be the same as the P5 Event simulation. For example: the failure of a control circuitry associated with a breaker trip coil results in the same analysis as the P4 for the breaker failing to open to clear a fault. Therefore, the P4 Event and the P5 Event may simulate the identical causality. However, if this simulation results in a performance requirement violation, the CAP must include mitigations for the P4 Event as well the P5 Event.

Extreme Events 2e-2h listed from the stability column of Table 1

Analysis of the data collected under the FERC Order No. 754 Section 1600 Data Request demonstrates the existence of a reliability risk associated with SPF in Protection Systems. Further, while the analysis shows that the risk from SPF is not an endemic problem and instances of SPF exposure are lower on higher voltage systems, the risk is sufficient to warrant further consideration. Risk-based assessment should be used to identify Protection Systems of concern (i.e., locations on the BES where there is a susceptibility to cascading if a Protection System component SPF exists). Given the risk to BES reliability, additional emphasis should be placed on assessment of three-phase faults involving a SPF on the Protection System. This concern, made manifest through the study of a three-phase fault and a SPF on a Protection System, is appropriately addressed as an extreme event in TPL-001-5, Requirement R4, Part 4.2. While less probable than SLG faults, three-phase faults frequently initiate as single-phase-to-ground with Delayed Clearing and often evolve into three-phase faults, leading to Delayed Fault Clearing scenarios more severe than the Table 1, Category P5 Event. TPL-001-5, Requirement R4, Part 4.2, specifies that an evaluation of possible mitigating actions be conducted if analysis concludes there is cascading caused by the occurrence of extreme events. Thus, the SDT has maintained the three-phase-fault given a Protection System component SPF as an extreme event, but encourages consideration of implementing mitigating actions if it is cost-effective to do so.

Requirement R3, Parts 3.2 and 3.5 and Requirement R4, Parts 4.2 and 4.5

The SDT proposes non-substantive editorial changes to combine part of Requirement R3, Part 3.5 with Requirement R3, Part 3.2. The rearrangement of Requirement 3, Parts 3.2 and 3.5 were done to improve consistency within the Standard and do not create any new requirements. This is also true for Requirement R4, Part 4.2 and 4.5. However, it should be noted that the evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the (extreme) event is intended to support and encourage the implementation of reasonable low-cost, cost-effective measures to lessen the risk or severity of these events.

Section 2: FERC Order No. 786 Directives

Background

In addition to addressing reliability issues involving SPF on Protection Systems, proposed Reliability Standard TPL-001-5 revises the TPL-001 standard to address two directives from FERC Order No. 786.

FERC Order No. 786 P. 40: Maintenance outages in the Planning Horizon

FERC Order No. 786, Paragraph 40 directs NERC to modify Reliability Standard TPL-001-4 to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments. Order No. 786 provides the following considerations:

- Planned maintenance outages less than six months may result in impacts during peak and off-peak periods;
- Planned outages during those times should be considered to allow for a single element to be taken out of service without compromising the ability to meet demand;
- Criticality of elements taken out for maintenance could result in N-1 outage and loss of non-consequential load or impact to reliability;
- Planned outages are not “hypothetical outages” and should not be treated as multiple contingencies in the planning standard (should be addressed in N-0 base case);
- Relying on Category P3 and P6 is not sufficient and does not cover maintenance outages;
- The Near-Term Transmission Planning Horizon requires annual assessments using Year One or year two and year five. Known planned facility outages of less than six months should be addressed so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon.

NERC SAMS Whitepaper Recommendations

To address this directive, the NERC SAMS recommended modifications to NERC Reliability Standards IRO-017-1 and TPL-001-4. The SAMS recommended that IRO-017-1 be used as the vehicle to assure that all types of known scheduled outages are being reviewed and coordinated to mitigate reliability impact as the most cost-effective means to address the intent of the NERC directive. The NERC SAMS also recommended modifying TPL-001-4, Requirement R1, Part 1.1.2 by removing “with duration of at least six months” and adding language referencing the outage coordination process developed in IRO-017-1, Requirement R1 as described above.

To understand the relationship between outage coordination and Transmission Planning Assessments, and how those relate to the FERC Order No. 786 directive and the current state of NERC Reliability Standards, SAMS considered the following:

- The duration of planned maintenance and construction outages can range from hours to many months or years. The impact that these outages can have on reliable operation of the BPS are irrespective of the duration of these outages, depending on many factors.
- Longer-term assessment of short-term outages or even longer-term outages is often considered an “academic exercise” due to concurrent outages, outage coordination practices and procedures, outage rescheduling and redesign, and alternative outage methods.
- The directives in FERC Order No. 786 pre-date the development of IRO-017-1, which was developed specifically to recognize the importance of outage coordination.
- Regional differences result in different outage coordination methods and procedures.

Revisions to TPL-001-4

Requirement R2, Parts 2.1.4 and 2.4.4

The SDT gave due consideration to the NERC SAMS recommendations and to a range of opinions and options regarding how to determine which known outages to include in the Near-Term Planning Assessment, which included varying, and sometimes conflicting, perspectives, such as that:

- the RC should not be consulted or involved at all in Planning Assessments,
- it is reasonable, appropriate, and efficient to consult with the RC,
- IRO-017 is adequate and applicable as it exists or with some modification, or
- maintenance outage selection for planning purposes should be at the sole discretion of the Transmission Planner or Planning Coordinator.

The range of these options reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these types of outages. Those differences contribute to a legitimate difficulty in designing a reasonable and cost-effective continent wide means of addressing the FERC directive. However, FERC Order No. 786 requires that the issue be addressed. The rationale for selecting the known outages to be studied must be well thought out and available. The proposed modification is for consideration of known outages beyond, and therefore outside of, the Operations Planning time horizon.

The most prominent change the SDT proposes to address the FERC directive was to migrate the assessment of known outages from Requirement R1, which requires that System models shall represent, to Requirement R2, Parts 2.1 and 2.4 which requires how analyses shall be assessed and supported by studies. The SDT believed that this proposed change to where the assessment of known outages is specified in the TPL-001-5 requirements better aligns the approach necessary for the planning entities to execute their annual Planning Assessments.

The SDT modified Requirement R2, Part 2.1.4 and 2.4.4 consistent with FERC's directive, eliminating the specified six month outage duration and recognizing the various means that Planning Coordinators and Transmission Planners currently employ to consider the maintenance outages of concern, while meeting the requirements of Order No. 786. The proposed modifications place limitations on the known outages that need to be considered. The Planning Coordinator and Transmission Planner must have either a documented outage coordination procedure or technical rationale to select which known outages shall be assessed. The documented outage coordination procedure is intended to include consultation with the affected Reliability Coordinator, consultation with Transmission and/or Generator Owner(s) affected by the known outage, or application of documented outage coordination processes. The technical rationale is intended to include well-reasoned technical bases for making the determination. Consistent with the intention of Order No. 786, the SDT included the specification that the limitation of known outages to be modeled cannot be based solely on the outage duration. However, the presence of other accompanying factors, which in conjunction with outage duration, may form a reasonable basis for supporting that the known outage need not be assessed. It is only necessary to consider known outages expected to cause more severe System impacts, such as those that may result in Non-Consequential Load Loss for P1 event in Table 1. This allows the Planning Coordinator and Transmission Planner to use applicable means to assess which known outages are significant and prevents the need for conducting unnecessary assessment of outages which the Planning Coordinator and Transmission Planner do not expect to be problematic. The System conditions, such as peak or Off-Peak, that are expected during the period when the known outage is planned further limits the "non-hypothetical" analyses that may be performed. While it is inappropriate to assume that all known outages simulated in conjunction with Category P0 or P1 Events are identical to Category P3 or P6 Events, past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1 . However, it is imperative for the Planning Coordinator or Transmission Planner to document the justification for

supporting the known outage exclusion based upon past or current studies and why the post-Contingency System conditions and configuration are comparable in their technical rationale.

Clarification: Does TPL-001-5 duplicate requirements of IRO-017-1 for outage coordination?

The SDT was concerned that in order for the Planning Coordinator and Transmission Planner to jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon, it must first assess the known outages as part of that Planning Assessment. However, if the Planning Coordinator or Transmission Planner does not know what outages to study, clearly outages may be omitted from having the opportunity for jointly developed solutions with the Reliability Coordinator, required in IRO-017-1. The SDT believed that the feedback loop between the planning entities and the Reliability Coordinator ends with the planning entities presenting their study results in the Planning Assessment, but must begin with strong collaboration and sourcing of information regarding known outages that should be studied beyond the Operations Horizon by the Reliability Coordinator. Therefore, the SDT does not believe that there is duplication between the proposed TPL-001-5 and IRO-017-1 standards. Moreover, the SDT believes there is an implied need to strengthen the collaboration and consultation between the Reliability Coordinator and the planning entities at the outset of determining the known outages that should be assessed in the Near-Term Transmission Planning Horizon.

FERC Order No. 786 P 89: Dynamic assessment of outages of critical long lead time equipment

In paragraph 89 of Order No. 786, FERC stated:

> The spare equipment strategy for steady state analysis under Reliability Standard TPL-001-4, Requirement R2, Part 2.1.5 requires that steady state studies be performed for the P0, P1 and P2 categories identified in Table 1 with the conditions that the system is expected to experience during the possible unavailability of the long lead time equipment. The Commission believes that a similar spare equipment strategy for stability analysis should exist that requires studies to be performed for P0, P1 and P2 categories with the conditions that the system is expected to experience during the possible unavailability of the long lead time equipment.

FERC did not direct a change but did direct NERC to consider this issue upon the next review cycle of TPL-001-4. The Project 2015-10 Standard Authorization Request included this issue within the scope of this project.

NERC SAMS Whitepaper Recommendations

The NERC SAMS considered the following key points related to FERC's Paragraph 89 guidance:

- Removal of Elements in the Planning Assessment for spare equipment strategy is only applicable for those Elements that have "a lead time of one year or more."
- Each long-lead time Element that is removed from service creates a new operating condition considered the "normal" (P0) condition for Table 1. The applicable contingencies will be studied with that Element removed from service in the pre-contingency state for stability analysis. For example, if a long-lead time transformer does not have a spare, it would be studied as a P1.3 event. Since P0 does not include an Event, P0 does not and should not be included in the stability analysis section for long-lead time Elements not included as part of a spare equipment strategy.
- System adjustments may need to be made to the power flow base case to accurately reflect reasonable and expected operating conditions with that Element removed from service in the pre-contingency (P0) operating state.

- TPL-001-4, Requirement R4, Part4.1.1, related to P1 Events, requires that no generating unit pull out of synchronism. The outage of a long-lead time Element followed by a P1 contingency should not result in a generating unit losing synchronism.
- TPL-001-4, Requirement R4, Part 4.1.2, related to P2 Events, allows for generating units to pull out of synchronism. The outage of a long-lead time Element followed by a P2 contingency should not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities.

The NERC SAMS white paper contains the flowing recommendations for stability analysis for long lead time Elements not included as part of a spare equipment strategy:

- The outage of long lead time Elements has an equally important impact from a stability standpoint as it does from a steady-state standpoint.
- The Planning Coordinator and Transmission Planner must demonstrate that they have met the TPL-001-4 performance criteria for specified contingency events and contingency combinations thereof as per Table 1. This should include long lead time outages that can occur for equipment that does not have a spare equipment strategy.
- TPL-001-4, Requirement R4, Part4.1.1 requires that no generating unit pull out of synchronism, while R4.1.2 allows for generating units to pull out of synchronism so long as the resulting instability does not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities. The outage of a long lead time Element followed by a P1 contingency should not result in a generating unit losing synchronism.
- While the P2 contingency allows for individual generating unit instability, the Transmission Planner and Planning Coordinator must ensure that this instability does not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities and therefore should include P2 contingencies event.

Revisions to TPL-001-4

Requirement R2, Part 2.4.5

Consistent with FERC's Order No. 786 guidance and the SAMS recommendations, the Project 2015-10 SDT revised TPL-001-4 Requirement R2, Part 2.4.5 to add a similar requirement for stability analysis. The change to Requirement R2, Part 2.4.5, which includes similar language to that used for the steady-state analysis under Requirement R2, Part 2.1.5, adds clarity that the outage of long lead time Elements has an equally important impact from a stability standpoint as it does from a steady-state standpoint and should be assessed commensurate with an entity's spare equipment strategy.

Section 3: Applicability

The requirements remain applicable to the Planning Coordinator and Transmission Planner. Coordination and cooperation between operating and planning entities in concert with asset owners will be required to implement the standard requirements. The planning entities and System Protection personnel that will need to collaborate when conducting the studies and submitting the data may be working for different companies or business units, and time will be required to accommodate the development of processes and data flow that cross company or business unit lines. Coordination with Generator Owners, Transmission Owners, and Distribution Providers will be necessary to evaluate the Protection System(s) for locations on the system where a failure of a non-redundant component of a Protection System could result in a potential reliability risk. Transmission Planners and Planning Coordinators must obtain this information, as well as resulting fault clearing times, to perform proper studies.

Project 2015-10 Single Points of Failure TPL-001

Cost Effectiveness

Known Outages FERC Order No. 786

FERC Order No. 786 Paragraph 40 directs a change to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments. See paragraphs 33-45 for the discussion on planned maintenance outages.

Overview of Commission Determination (Paragraphs 40-45)

The commission stated in Order No. 786 Paragraph 41:

- For the reasons discussed below, the Commission finds that planned maintenance outages of less than six months in duration may result in relevant impacts during one or both of the seasonal off-peak periods.
- Prudent transmission planning should consider maintenance outages at those load levels when planned outages are performed to allow for a single element to be taken out of service for maintenance without compromising the ability of the system to meet demand without loss of load.
- We agree with commenters such as MISO and ATCLLC that certain elements may be so critical that, when taken out of service for system maintenance or to facilitate a new capital project, a subsequent unplanned outage initiated by a single-event could result in the loss of non-consequential load or may have a detrimental impact to the bulk electric system reliability.
- A properly planned transmission system should ensure the known, planned removal of facilities (i.e., generation, transmission or protection system facilities) for maintenance purposes without the loss of non-consequential load or detrimental impacts to system reliability such as cascading, voltage instability or uncontrolled islanding.

The Commission Disagreed with the following:

- Order No. 786 Paragraph 44: The existing TPL-001-4 for Category P3 covers generator maintenance outages, Category P6 covers transmission maintenance outages.
- Order No. 786 Paragraph 45: Planned outages of less than one year in duration should be addressed operationally by determining new operating limits and taking other actions to mitigate the planned outage.
- Order No. 786 Paragraph 45: Planned outages of less than six months is unnecessary since…10 year time frame.

Standard Drafting Team (SDT) Proposal for Known Outages

The SDT did not feel like a time duration alone would capture “significant outages.” Additionally, the language allows TP’s and PC’s to develop a process for selecting “significant outages” to be studied in the Near-Term Transmission Planning Horizon utilizing their knowledge or other study results to aid in determination of significant outages. The team removed Requirement R1, Part 1.1.2. The team has modified Requirement R2, Parts 2.1.4 and 2.4.4 as show below. Please not that Requirement R2, Parts 2.1.4 and 2.4.4 were respectively, 2.1.3 and 2.1.4. The SDT has re-organized the Requirements to provide a better flow.

Proposed Revisions (Draft 4):

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

~~1.1.2. Known outage(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected for analyses pursuant to Requirement R2, Parts 2.1.3 and 2.4.3 only. Known outage(s) shall be selected according to an established procedure or technical rationale that, at a minimum:~~

~~**1.1.1.1.** Includes known outage(s) that are expected to result in Non-Consequential Load Loss for P1 events in Table 1 when concurrent with the selected known outage(s); and~~

~~**1.1.1.2.** Does not exclude known outage(s) solely based upon the outage duration.~~

~~1.1.3.~~1.1.2. New planned Facilities and changes to existing Facilities.

~~1.1.4.~~1.1.3. Real and reactive Load forecasts.

~~1.1.5.~~1.1.4. Known commitments for Firm Transmission Service and Interchange.

~~1.1.6.~~1.1.5. Resources (supply or demand side) required for Load.

Requirement R2, Parts 2.1.4 and 2.4.4 (Draft 4)

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning coordinator or Transmission Planners's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

Single Point of Failure of the Protection System (Footnote 13)

Based on Order No. 754 directive of September 15, 2011; NERC informational filing dated March 15, 2012; Section 1600 data request; and the 2nd NERC informational filing dated October 30, 2015, the System Protection and Control Subcommittee (SPCS) and System Analysis and Modeling Subcommittee (SAMS) report to address the concern of Single Point Of Failure of a protection system:

- For Table 1 – Steady State & Stability Performance Planning Events, Category P5:
  - Replace "relay" with "component of a Protection System," and
  - Add superscript "13" to reference footnote 13 for the replaced term under the "Category" column.
- For Table 1 – Steady State & Stability Performance Extreme Events, under the Stability column, No. 2:

- Remove the phrase "or a relay failure13" from items a, b, c, and d to create distinct events only for stuck breakers.
- Append four new events for the same items a, b, c, and d in the above bulleted item to create distinct events replacing "a relay failure13" with "a component failure of a Protection System13."

- Replace footnote 13 in TPL-001-4 with, "The components from the definition of "Protection System" for the purposes of this standard include (1) protective relays that respond to electrical quantities, (2) single-station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), and (3) DC control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices."[1]
- Modify TPL-001-4 (Part 4.5) so that extreme event assessments must include evaluation of the three-phase faults with the described component failures of a Protection System13 that produce the more severe system impacts. For example, add a new second sentence that reads "[t]he list shall consider each of the extreme events in Table 1 – Steady State & Stability Performance Extreme Events; Stability column item number 2."

Revisions by the SDT to Satisfy FERC Order

The recommendations from the SPCS and SAMS report were so specific, there were no other options considered. The SDT has made revisions for further clarification based on team discussion and industry comment.

Proposed Revision (Draft 4)

13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows:

   a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times;

   b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (except a single communication system that is both ~~which is not~~ monitored ~~or not~~ and reported at a Control Center shall not be considered non-redundant);

   c. A single station dc supply associated with protective functions required for Normal Clearing, ~~and that~~(except a single station dc supply that is ~~not~~ both monitored ~~or not~~and reported at a Control Center for both low voltage and open circuit shall not be considered non-redundant);

   d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except a single trip coil that is both monitored and reported at a Control Center shall not be considered non-redundant).

SDT Proposal for Table 1 Footnote 13:

The SDT added clarifications to the previous draft option which expands Protection System components to be considered to determine the impact to the BES if that component failed when a fault occurs.

Extreme Events:

The SPCS and SAMS report for Order No. 754 recommended that three phase faults involving single points of failure of a protection system be addressed. Additionally, the standard drafting team recognized that the Order No. 754 data requirement collected data for a three-phase fault and not a single-line-ground fault. The Order No. 754, Section 1600 data collection and report indicated a risk to the BES for three phase faults followed by single points of failure of a protection system. The standard drafting team feels that there is a reliability risk to the BES if Cascading or instability results in a three-phase fault followed by single point of failure of a protection system. The SDT decided to make this an Extreme Event if a three-phase fault following by a single points of failure resulted in Cascading or instability following industry comments.

Standards Announcement

Reminder

Project 2015-10 Single Points of Failure

Additional Ballots and Non-binding Poll Open through September 14, 2018

Now Available

The additional ballots for **TPL-001-5 – Transmission System Planning Performance Requirements** and implementation plan, and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Friday, September 14, 2018.**

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here. If you experience issues using the SBS, contact Wendy Muller.

- *If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual**.**

For more information or assistance, contact Senior Standards Developer, Latrice Harkness (via email) or at (404) 446-9728.

UPDATED Standards Announcement

Project 2015-10 Single Points of Failure

Formal Comment Period Extended: Open through September 14, 2018

Now Available

A 45-day formal comment period for **TPL-001-5 – Transmission System Planning Performance Requirements** is open through **8 p.m. Eastern, Friday, September 14, 2018.**

The Implementation Plan has been updated to reflect a revised compliance date. The comment period has been extended to provide stakeholders adequate time to review the updated documents and provide meaningful feedback.

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. If you experience issues navigating the SBS, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

- *If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **September 5-14, 2018**.

For information on the Standards Development Process, refer to the Standard Processes Manual**.**

For more information or assistance, contact Senior Standards Developer, Latrice Harkness (via email) or at (404) 446-9728.

Standards Announcement

Project 2015-10 Single Points of Failure

Formal Comment Period Open through September 11, 2018

Now Available

A 45-day formal comment period for **TPL-001-5 – Transmission System Planning Performance Requirements** is open through **8 p.m. Eastern, Tuesday, September 11, 2018.**

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. If you experience issues navigating the SBS, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

- *If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **August 31 – September 11, 2018**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Latrice Harkness (via email) or at (404) 446-9728.

Comment Report

Project Name:	Project 2015-10 Single Points of Failure | TPL-001-5 Draft 4
Comment Period Start Date:	7/30/2018
Comment Period End Date:	9/14/2018
Associated Ballots:	2015-10 Single Points of Failure TPL-001-5 AB 3 ST 2015-10 Single Points of Failure TPL-001-5 Implementation Plan AB 2 ST

There were 51 sets of responses, including comments from approximately 148 different people from approximately 96 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

2. Do you agree with the removal of Requirement 1, Part 1.1.2 and changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4, in order to meet the FERC directive in Order No. 786?

3. Do you agree with the proposed revisions to TPL-001-4?

4. Do you agree with the proposed implementation plan?

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 754 and Order No. 786?

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

AEP remains concerned by the increased complexity of P5 due the expansion of footnote 13. As written, this footnote requires one to consider a variety of scenarios, including backup zone 2 clearing of a transmission line for pilot relay or pilot communication failure, a breaker failure scenario initiated by trip coil failure (often the same as P4), or remote clearing of a station such as would occur upon a non-redundant bus differential failure.

In order to avoid having to evaluate zone of protection clearing times for every conceivable protection outage condition and document the "consideration" of each of the sub-items under footnote 13, AEP suggests a more generalized P5 event description by adding the text "or Remote (Delayed) Fault Clearing." As a result, it would then read: "Delayed Fault Clearing ***or Remote (Delayed) Fault Clearing*** due to the failure of a non-redundant component of a Protection System protecting the Faulted element to operate as designed, for one of the following: 1. Generator, 2. Transmission Circuit, etc."

This would continue to make use of the existing glossary term…

Delayed Fault Clearing – Fault clearing consistent with correct operation of a breaker failure protection system and its associated breakers, or of a backup protection system with an intentional time delay.

This existing term covers zone 2 backup clearing of transmission lines as well as being duplicative of P4 CB failure scenarios. As a result, a new definition is necessary to cover a gap:
Remote (Delayed) Fault Clearing – Fault clearing necessary to be accomplished at stations one removed from a faulted station bus or other faulted station equipment as a consequence of a protection system single point of failure at the faulted station.

This new term is necessary because relays may not be set with an intentional time delay for clearing remote station faults, and remote clearing may be necessary for non-redundant bus differential schemes. Whether "Delayed" is included in this new term may be immaterial since, while clearing times may be long, there may be no intentional delay, just inherent delay. Footnote 13 could then removed from the draft standard, and instead, be added to the technical supplement to the standard. The would explain the possible causes of delayed clearing or remote delayed clearing, instead of rigorously having to be part of the standard and introducing what we would regard as unnecessary compliance burdens.

Bridget Silvia - Sempra - San Diego Gas and Electric - 3	
Answer	No
Document Name	
Comment	
Footnote 13 is unnecessary. The available powerflow software doesn't simulate protection system equipement (relays, communication systems, dc supplies or control circuitry). The software simulates the transmission network. A protection system failure is simulated by making assumptions about the system's response to the failure and then simulating it. Adding specific equipment to the standard does change the simulation. Without actual protection equipment in the model, it falls on the engineer to make the correct assumptions when doing the simulations. As it should be.

The phrase "comparable Normal Clearing times" is not consistent with the existing definition of "Normal Clearing" found within the Glossary of Terms Used in NERC Reliability Standards. Additionally, "comparable Normal Clearing times" is not sufficiently clear to allow consistent interpretation for purposes of enforcing the standard.

Comment	
Footnote 13 does not include all of the applicable single points of failure addressed by 754, such as instrument transformers, and in some cases, includes aspects that do not represent single points of failures, such as redundant breaker trip coils. With regard to breaker trip coils, the lack of two trip coils in a circuit breaker increases the potential for a breaker failure issue (P4), but does not create a relay failure issue since the absence of redundant trip coils would not prevent initiation of breaker failure for failure of a single trip coil.

Comment	
TVA agrees with the contents of Footnote 13a, b, and c. However, TVA believes Footnote 13d represents a significant cost impact for a very small probability event. Redundancy of DC control circuitry will result in significant station upgrades or, in many instances, require the construction of new switch houses. TVA believes there is not an economic justification of Footnote 13d based on the historical failure rate of DC control circuitry.

We suggest to clarify the wording for b), c) and d). The word “except” in parenthesis is awkward. This word perhaps could be replaced with “An exception is”…..

Kayleigh Wilkerson - Lincoln Electric System - 5, Group Name Lincoln Electric System	
Answer	No
Document Name	
Comment	

Footnote 13a:

The word “comparable” in footnote 13a requires additional clarification. The Technical Rationale contains conflicting explanations of what is meant by “comparable Normal Clearing times”. In the “Clarification: Is backup protection redundant?” section it appears that a secondary relay would not be considered redundant as the clearing times are not exactly the same as the primary relay. However, in the section titled “Clarification: What is comparable and what is not comparable for purposes of footnote 13?” it appears that slightly slower secondary relaying would be considered redundant if its results in “fault clearing within the expected Normal Clearing time period and isolate the fault by tripping similar System Elements”. LES recommends modifying the Technical Rationale to clarify the drafting team's intent or else consider modifying footnote 13a to instead state “...that provides comparable Normal Clearing times **(e.g. piloted primary relay and non-piloted secondary relay with different Normal Clearing times)”** to ensure comparable isn't mistaken to mean having identical Clearing times.

Footnote 13c:

Is it the Standard Drafting Team’s intent to consider all substations that don’t have either open circuit monitoring on a single battery bank or two battery banks as non-redundant? LES feels the lack of open circuit monitoring as described in footnote 13c is too restrictive to consider a single station DC supply as non-redundant. Although the Technical Rationale section titled “Clarification: Is a battery charging system appropriate redundancy for the battery?” indicates a battery charger “may not be of sufficient power to source current necessary to operate one or more breakers”, LES feels the individual utility should be permitted to analyze each substation configuration to determine if an open circuit does in fact constitute a non-redundant DC supply.

Additionally, is it the Standard Drafting Team’s intent that non-redundant DC supply be modeled as an entire substation outage? This seems to be the case based on the statement “prevent the operation of all local protection” within the section titled “Clarification: Why are DC supplies addressed?”. However, this is not realistic during an open circuit or low voltage situation as the relays would still be operational and only the backup protection for one line or bus section would operate during a transmission line fault. Additionally, the open circuit monitoring requirement seems unnecessary as PRC-005 provides adequate testing for open circuits. Based on this, LES recommends “open circuit” be excluded from the footnote or else additional detail added to allow for analysis of substation configuration and DC supply capability during an open circuit condition.

Dana Klem - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF	
Answer	No

Document Name	
Comment	

Comments: Please consider the following:

Remove the double negative wording in 13.b, 13.c, and 13.d to make it clearer and less complicated with wording like, “shall be considered redundant”.

Add wording like, “Backup protection or a Composite Protection System is an acceptable alternative to a fully identical redundant protection if it provides acceptable System performance.” at the end of Footnote 13. A statement like this needs to be in the standard. Otherwise, it can be disregarded in an audit. In addition, replace the “Clarification: Is backup clearing redundant?” section on page 3 of the Technical Rationale with a different question and discussion like the following:

Clarification: “When is backup protection or a Composite Protection System acceptable as an alternative to fully identical redundant protection?”

If backup protection or a Composite Protection System (defined in PRC-004) provides acceptable System performance when a component of the primary Protection System fails, then fully identical redundant protection is unnecessary. Backup protection or a Composite Protection System may result in delayed clearing in comparison to a primary Protection System and trip additional Elements (refer to the NERC definition of Delayed Clearing and Normal Clearing Times). However, if any of these protection alternatives result is acceptable System performance, then fully identical redundant protection is unnecessary. If one of these protection alternatives already exist, then no Corrective Action Plan is needed. Or if one of these protection alternatives is effective, then it could be used as a suitable Corrective Action Plan in lieu of a fully identical redundant Protection System.

The terms and application of the terms in Footnote 13 do not appear to be consistent with those used in PRC-004 standard and the definition of Delayed Clearing and Normal Clearing Times in the NERC Glossy of Terms. The wording in the standard and the Technical Rationale should include and discuss the terms, Delayed Clearing and Normal Clearing Times and Composite Protection System and be consistent with them.

Add other statements at the end of Footnote 13 to clarify and confirm key matters in the TPL-001 standard so that it cannot be disregarded in an audit. The proposed wording for these statements are the following:

- “Voltage and current sensing devices of a Protection System are not considered.” Discussion of this matter is only in the Technical Rationale (p. 4) right now.
- “Protective relays (such as sudden pressure relays or thermal temperature relays) that do not respond to electrical quantities shall not be considered redundant”. Discussion of this matter is only in the Technical Rationale (p. 5) right now
- “The reclosing relays of a Protection System are not considered.” This matter is not presently discussed in the Technical Rationale.
- “Two communication systems must use separate communication paths (e.g. not be the same power line carrier line, same OPGW, same microwave tower, or same tone path, etc.) to be considered redundant. A SONET ring shall be considered redundant.” This matter is not presently discussed in the Technical Rationale.
- “Control circuitry includes everything from the DC supply through and including the trip coils, as well as auxiliary and lockout relays. A trip coils with monitoring do not need to be redundant.” This matter is not presently discussed in the Technical Rationale.

Remove the single communication system exemption when a system is monitored and reported to a Control Center. This exemption exposes Transmission Operators (TOPs) to potential noncompliance with TOP-001 (and TOP-002 if the communication failure condition continues into the next operating day). In the real time environment, TOPs must respond to the loss of communication until that pathway is repaired. Under the definition of Real Time Assessment, which is used in TOP-001, TOPs must operate within all SOLs for the topology that exists at that moment, which explicitly includes the status of protection systems. With the loss of protective function communication, the delayed clearing due to a SLG fault could cause an unacceptable system stability performance deficiency. TOPs do not have real-time stability analysis tools to keep checking pre-contingency for potential unacceptable system stability and appropriate new/temporary SOLs. Removal of the exemption would result in planning horizon analysis of non-redundant communication failures and corrective actions when unacceptable stability performance is found. Therefore, removal of the exemption would reduce the risk of TOPs being noncompliant with TOP-001 and TOP-002.

The Technical Rationale does not clarify whether two communication systems must use to separate communication paths (e.g. not the same power line carrier line, single OPGW, microwave tower, tone path, etc.) to qualify as non-redundant systems. The Technical Rationale does not clarify whether control circuitry must use separate paths (e.g. not the same control panel, wire tray, etc.) to qualify as non-redundant circuitry.

Duke Energy requests further clarification on the use of the term “monitoring” in Footnote 13 item b. Is it the drafting team’s intent, that “monitoring” should be continuous in nature, or would a once a day “check back” of the protection system meet the drafting team’s intent for monitoring? More clarification is needed on this point.

We believe that the current draft of Footnote 13 is reasonable and will lower reliability risk.

To avoid confusion, we suggest eliminating the use of double negative statements in Footnote 13. Therefore we suggest changing the phrase “shall not be considered non-redundent” to “shall be considered redundant” at the end of the sentence for 13b, 13c, and 13d.

The term “comparable Normal Clearing times” as stated in 13.a. may cause inconsistent interpretation between entities and auditors as to what is considered comparable. Consider replacing “…without an alternative that provides comparable Normal Clearing times” with wording used in the Technical Rationale such as “…without an alternative that clears the fault within the time period expected if the single protective relay (that is simulated to fail as a SPF) were to function properly.”	

Consider replacing the double negative wording in 13.b, 13.c and 13.d (“shall not be considered non-redundant”) with “shall be considered redundant.”

We suggest that the term “shall not be considered non-redundant” be removed in subsections b), c), and d). Also, we suggest changing the term “except” to “unless” for the three sections. In d), regarding control circuitry, we suggest the following language change: *(unless a single trip coil that is both monitored and reported at a Control Center if it is the only single point of failure in the control circuitry).*

We agree with the rational and contents of footnote 13 except for the exception for non-redundant communication equipment that is monitored and alarmed in 13b. Our concern with this exception is that teleprotection equipment that is part of a communication system may be in a failed state and not always generate an alarm.

The SPP Standards Review Group (SSRG) recommends the Standards Drafting Team (SDT) provide clarity on the statement "for Normal Clearing". NERC defines "Normal Clearing" as a situation where "[a] protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems." If a communications system associated with protective functions is installed to provide faster tripping than required, does this fall into the "Normal Clearing" definition? If so, the installed communications system associated with protective functions to clear faults faster than necessary is a single point of failure. The SSRG recommends the SDT consider adding language to the technical rationale document that explains the inclusion of the communication system associated with protective functions as a single point of failure.

No.

Westar Energy and Kansas City Power & Light Co. suggest that in Footnote 13d, single lockout relays that are monitored and report to a Control Center should be afforded the same exception as single trip coils that are monitored and reported to a Control Center.

Without the exception, the number and/or complexity of studies are unnecessarily increased with little benefit to reliability.

The companies offer the following revision:

d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except **when either** a single trip coil **or a single lock out relay** is both monitored and reported at a Control Center shall not be considered non-redundant)

Comment

American Transmission Company (ATC) has concerns about the application and consistency of terms used in Footnote 13 compared to those used in other standards and the NERC Glossary of Terms, specifically Delayed Clearing and Normal Clearing Times. Reliability Standard PRC-004 introduced the term "Composite Protection System," whose definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. A failure of a Protection System component is not a Misoperation if the performance of the Composite Protection System is correct. A slower than typical operation of a Composite Protection System is considered a Misoperation if the delay results in the operation of at least one other Element’s Composite Protection System. Normal Clearing Time of a Composite Protection System in the context of this standard could be interpreted as the clearing time of the slower of the redundant systems, as long as this clearing time does not result in the operation of another Element’s Composite Protection Systems and acceptable system performance for the scenarios outlined in Footnote 13. However, such guidance or interpretation is currently missing from the Standard or Technical Basis.

In addition, ATC has concerns regarding the application of Footnote 13. Specifically, although monitoring of communication equipment has the potential to reduce the exposure to risk of delayed tripping, it does not eliminate the risk. By not requiring the analysis of delayed clearing on lines lacking redundant communication in the Planning Horizon, ATC (and other companies) may not identify transmission lines that need redundant communication to maintain generator or system stability. During a communication failure event, real-time operations is required to study the impact of delayed clearing for SLG or three- phase faults and mitigate any issues. This particular real-time requirement is maintained in the recent draft standards under Project 2015-09 Establish and Communicate System Operation Limits. It is not clear why the planning study requirements do not align with the operation requirements and require advance study of the same concern. Furthermore, this exemption presents a real risk to the system reliability. The Footnote 13 language transfers identification of this reliability risk into the real-time environment, where the tools used to identify dynamic instability do not typically exist. Regardless of whether the event actually occurs, the proposed Footnote 13 language creates a gap in the standards and exposes registered Transmission Operators to potential non-compliance under TOP-001 (and TOP-002, if the communication failure condition continues into the next operating day) for having failed to identify a stability related SOL and then operated the system to that limit.

In the real-time environment, ATC must respond to the loss of communication until that pathway is repaired. Under the definition of Real Time Assessment, which is used in TOP-001, ATC must operate within all System Operating Limits (SOLs) for the topology that exists at that moment, which explicitly includes the status of Protection Systems. With the loss of communication for a particular path, delayed clearing could exist for a fault and the response of the system or nearby generation may not be stable. Real-time tools would not identify the instability, and ATC would not identify the SOL to which it should have been operating. Identification of these issues should occur in the System Planning domain, where it then can be passed through to the Transmission Operator in accordance with FAC-014. The Planning environment has sufficient time to consider these scenarios to help ensure that the instability is corrected, whether that corrective action is a system reconfiguration or a new system or generator limitation for that condition.

There are additional opportunities to align terminology between PRC-005 and TPL-001 if the Standard Drafting Team continues with the use of a monitoring and alerting exemption. Some examples include "Control Center" versus "location where corrective action can be initiated" and "Open-Circuit" versus "battery continuity." Furthermore, the standard fails to address what is an acceptable monitoring period that could be used for non-redundancy or time in which corrective action would be required. Some devices are monitored in-real time, while others test less periodically, including once a day or monthly. Finally, the standard as currently written fails to address those systems that are part of non-battery-based systems.

The use of double negatives in Footnote 13 is confusing (e.g., not considered non-redundant). Consider modifying the wording of the P5 requirement to Fault plus failure of a component of a Composite Protection System which results in remote and/or delayed clearing. In this context, delayed clearing would be a delay beyond the slower of redundant systems as described above. The footnote could be simplified to state that components to be considered include protective relays, communication systems, DC supply, and control circuitry associated with the protective functions.

The redundancy of communication paths needs to be addressed. Consider the following clarification, “Communication systems are considered fully redundant if, for any single component failure such as power line carrier equipment, microwave tower, tone path, or OPGW, one communication system remains fully functional.”

ATC is concerned about the impact of mitigation of single station DC failures for stations without open circuit monitoring. Monitoring reduces the exposure to risk but cannot mitigate it. While monitoring and alerting systems are starting to become available within the industry, from ATC's perspective, they are not widely implemented. The result would be any BES facility without redundant DC supplies being tested for P5 bus section contingencies will result in delayed clearing. For the sites that fail this scenario, ATC would elect for redundant DC supplies due to future concerns about the true "redundancy" of monitored equipment. The result would likely mean building new control houses at significant cost due to space constraints at existing facilities. Finally, it is unclear as to what the appropriate evidence would be to demonstrate compliance with Footnote 13. There is no indication of what evidence type would be required to demonstrate that entities have redundancy or monitoring. Verification of redundancy of control circuitry could drive assembly of a significant number of station drawings, inventories, and other pieces of evidentiary documentation to prove redundancy. This verification has the potential to be extremely burdensome for both the industry and audit staff.

Comment	
Footnote 13 items “b”, “c”, and “d” contain the parenthetical language “(except […] that is both monitored and reported at a Control Center shall not be considered non-redundant)”. It can be argued that monitoring and reporting these quantities at a Control Center does not adequately address the potential failure of these systems when called upon to act. I.e., just because the monitoring and reporting at a Control Center indicates that these systems are functional does not necessarily mean that they will function properly when called upon. There should be no argument that redundancy in items “b”, “c”, and “d” is more reliable than SPFs that are monitored at a Control Center; however, Peak can accept the risk-based decision and justification that, as quoted in the rationale document, “components that may be SPF but are monitored and reported to a Control Center exhibited lower risk on par with being redundant, and therefore did not warrant P5 Event simulation.”

The contents of Footnote 13 now provide additional clarification of Requirement expectations as it relates to non-redundant Protection Systems. However, including this level of detail in planning assessments raises concerns: 1. Is consideration of the Protection System details even possible or practical given the state of available information and modelling tools? 2. Does the complexity of the resulting models and planning assessments create an increased opportunity for incorrect results? 3. Will it essentially create a new “design” standard that will lead to increased protection system redundancy for all transmission facilities regardless of the impact on BES reliability. 4. By considering the conditions for monitoring Protection System components (e.g. trip coil, DC Supply, etc.), there is an indirect impact on existing Requirements included in PRC-005, which also consider component monitoring when establishing maintenance periodicity.

2. Do you agree with the removal of Requirement 1, Part 1.1.2 and changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4, in order to meet the FERC directive in Order No. 786?	
Gregory Campoli - New York Independent System Operator - 2	
Answer	No
Document Name	
Comment	
The NYISO agrees that the removal of Req. 1, Part 1.1.2 will still meet the objective of FERC Order No. 786. We do not agree with the changes to Req. 2, Parts 2.1.4 and 2.4.4. We believe the assessment should be performed for all contingencies listed in Table 1, since all such contingencies are studied in the Operations Horizon. Not including all Table 1 contingencies in Req. 2 introduces a gap between the Near-term Planning and Operations Horizon assessments, poetentilally leading to a reliability gap. Other proposed NERC Standards, such as FAC-011-3, FAC-014-2, and FAC-015-1 are proposed to, among other things, improve the coordination between Planning and Operations. The proposed revisions here seem contrary to that intent.

We find the new language difficult to interpret. We provide the following comments for consideration to make the requirements more succinct: The language seems to indicate a new procedure, or an edit to an existing procedure is required. We do not think the requirement should stipulate a new or modification to a procedure. We suggest revising the requirement as follows (applicable to both 2.1.4 and 2.4.4): *When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages expected to produce more severe System impacts on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with outage coordination procedure(s) or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. Past or current studies may be used to support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.* Additionally, the following sentence could be removed from the requirement and added to the technical rationale: *Past or current studies may be used to support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1."* The new Requirement – R2 parts 2.1.4 / 2.4.4 – is open ended and may result in Transmission Planners (TP) performing almost a "real-time" operations analysis (i.e., what is the impact of this outage / what about that outage) in-lieu of designing the Bulk Electric System (BES), which is the purpose of TPL-001. NERC IRO-017 *Outage Coordination*, which purpose states "*To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon*", was established for this purpose, and the proposed TPL-001 change would represent a spillover from IRO-017.

Comment	
We find the new language difficult to interpret, and possibly redundant. We provide the following suggestions for consideration to make the requirements more succinct. The documented outage coordination procedure or technical rationale should cover the rationale for outage selection.	

When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

Additionally –

The new Requirement – R2 parts 2.1.4 / 2.4.4 – is open ended and may result in Transmission Planners (TP) performing almost a "real-time" operations analysis in-lieu of designing the Bulk Electric System (BES), which is the purpose of TPL-001. NERC IRO-017 Outage Coordination, which purpose states "To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon", was established for this purpose, and the proposed TPL-001 change would represent a spillover from IRO-017.

IRO-017 R4 states:

Each Planning Coordinator and Transmission Planner shall jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon.

The intent and requirements of IRO-017-1 R4 and proposed TPL-001-5 R2 parts 2.1.4 / 2.4.4 seem to overlap, potentially causing confusion.

TVA does not agree with the proposed revision. These studies are already performed in the operational arena, therefore there is no benefit in recreating this analysis in the planning horizon. If issues were found in the planning horizon, the corrective action(s) would be to forego the outage or to create an operating guide. The operational cases have a more accurate near-term load/generation profile which are more appropriate for these studies. Recreating these studies in the planning horizon would add no value, but take siginificant new effort and time to complete. Outages in the planning horizon should be studied by the TP, while those in the operations horizon should be studied by the TOP.

Comment

In our opinion, any known/planned outages of major equipment for maintenance or construction should be included in the appropriate models to be assessed for P0-P7 planning events. Therefore, Requirement 1, Part 1.1.2 needs to be retained except for the words “with a duration of at least six months”.

We propose alternative language to Part 1.1.2 as follows:

"Known outage(s) of generation or Transmission Facility (ies) scheduled in the Planning Horizon."

Modification to Part 1.1.2, as proposed above, would also allow the last bullet of Part 2.1.3 to remain as an option for a sensitivity study.

We disagree with the language proposed for new Part 2.1.4. We disagree with the phrase "selected known outages" (line 2) as we believe this is not the intent of the Commission to pick and choose which planned outages should be assessed. We disagree with the development of a "documented coordination procedure" (line 5) as Transmission Planners and Planning Coordinators do not coordinate outages. Instead, we believe that a documented methodology or collection process to obtain the outages scheduled in the Planning Horizon needs to be developed. We disagree that the proposed assessment shall be performed for only the P0 and P1 planning events (lines 8 and 9), as we do not believe these analyses are sufficient to identify areas for non-consequential load loss during times of maintenance outages. We believe that if the changes to Part 1.1.2 are included as proposed above, then much, if not all, of the proposed Part 2.1.4 can be eliminated, which would be an enhancement to the standard.

As the FERC expressed in paragraph 42 of its Order 786, "The Commission's directive is to include known generator and transmission planned maintenance outages in planning assessments, not hypothetical planned outages." In our opinion, the language included at the end of Part 2.1.4

(lines 13-16) regarding "Past or current studies may support the selection of known outage(s) …" continues to support the idea of developing hypothetical or speculative outages based on previous analysis of Table 1 Planning Events P1-P7. Clearly this does not meet the intent of the Commission to include only planned maintenance outages, and in our opinion goes well beyond the directive.

If Part 2.1.4 is to remain, we propose that the language be changed to something similar to the following:

"When known generator and transmission maintenance outages are planned in the Near-Term Planning Horizon, the impact of these maintenance outages shall be assessed. The known outages included in the models shall be supported with a documented outage collection methodology/procedure or technical rationale for inclusion developed by the Transmission Coordinator or Transmission Planner."

Our concerns for Part 2.1.4 also apply to Part 2.4.4. For the reasons stated above, we cannot support the changes proposed by the SDT to meet the FERC directive.

As indicated in the Applicability section of TPL-001, applicability of this requirement falls on the PC and the TP. It should be noted that the TP does not own transmission assets under the TP fuction registration. Holding a TP accountable for knowing outage status of equipment in a planning model is nonsenscial. The outage of transmission equipment is determined by those entities requesting the outage, where the burden of proof should fall on the applicable entities providing data for building models under MOD-032-1 and not the TP. As noted in R1, planning models "shall represent projected System conditions"; the TP does not have full visibility of these projected system conditions, but expects that data submitted for building of the planning models, in accordance with MOD-032-1, is as accurate as the system being projected in each of the respective planning models. Additionally, the proposed TPL-001-5 Draft 4 language "These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration." Should be removed, since the TP does not own transmission assets.

Moving the requirement for Order No. 786 to to Requirement 2 is fine. However, MISO does not agree with the characterization of planned maintenance with respect to the role of transmission planning – which is to provide for an orderly transmission expansion program that ensures the transmission system is adequate, reliable, robust and resilient at all times in the future given the lead times associated with making necessary system improvements. This is more fully described in the response to question 3 below.

NIPSCO believes any potential issues associated with planned maintenance outages are best identified through operational studies such as real time, next-day, and seasonal analysis rather than through the annual TPL-001-4 system performance analysis. Planned maintenance outages are almost always of short duration and are commonly scheduled to avoid occurrence during critical peak seasons. Only planned maintenance outages which are reasonably expected to occur during critical peak seasons, such as those six months or longer, should be included in the annual TPL-001-4 system performance analysis.

Removing the existing six month threshold for planned maintenance outages and continually reducing the time of duration requires the analysis of an ever greater number of concurrent generator and line outages beyond any specified in the TPL-001-4 standard including (P2) bus+breaker fault, (P4) stuck breaker, and (P7) common tower. This moves the performance analysis requirements of the TPL-001-4 standard closer to an effective N-2 requirement, which is currently an Extreme event, which was never intended.

BPA believes that removing Part 1.1.2 is appropriate. BPA does not feel that it is appropriate to incorporate it under R2. The system assessment process and the outage process are separate and distinguishable processes that should not be dependent on each other for purposes of compliance. BPA's preference would be for the planned outages process to be in a new standard entitled Long Range Outage Coordination Process. If this is not feasible, due to being outside the scope of the project, BPA would like to see two new requirements created for known outages planned for steady state analysis and known outages planned for stability analysis. It may make sense to create new subrequirements under R3 and R4 respectively, or have them be stand alone requirements. BPA is ok with the content of the requirement, just not the location of the requirement.

The new Requirement – R2 parts 2.1.4 / 2.4.4 – is open ended and may result in Transmission Planners (TP) performing almost a "real-time" operations analysis (i.e., what is the impact of this outage / what about that outage) in-lieu of designing the Bulk Electric System (BES), which is the

purpose of TPL-001. NERC IRO-017 *Outage Coordination*, which purpose states "*To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon*", was established for this purpose, and the proposed TPL-001 change would represent a spillover from IRO-017.

We maintain that Planning Assessments and Operations Planning shall be coordinated. As currently proposed, the TPL standard only requires P1 events to be simulated when assessing planned outages in the Near-Term Transmission Planning Horizon. However, this is inconsistent with existing standards FAC-011-3 R3 and FAC-014-2 R6, which require the Reliablity Co-ordinator (RC) also to consider multiple contingencies when assessing these outages. Therefore, at a minimum, when the Planning Co-ordinator is assessing planned outages occurring in the Near Term Transmission Planning Horizon, they should simulate the contingencies that the RC would simulate when assessing and approving these outages, otherwise operations is held to more stringent/conservative performance than planning. Moreover, NERC Project 2015-09 (Establish and Communicate System Operating Limits) has proposed modifications to FAC-011-3 and FAC-014-2, and a new Reliability Standard FAC-015-1 that are aimed at improving the coordination between planning and operations. The proposed FAC-011-4 R5 requires the RC in its SOL Methodology to identify any additional single contingencies (beyond P1 contingencies) or multiple contingency events for use in performing Operational Planning Analysis and Real-time Assessments and for identifying stability limits. Hence, in order to improve this coordination between planning and operations and to eliminate any potential reliability gaps between these plans, the IESO proposes that TPL-001-5 Requirement R2 Parts 2.1.4 and 2.4.4 should require at least the same contingencies to be assessed as part of the Planning Assessment for outage conditions as the ones identified in proposed FAC-011-4 Requirement R5 Parts 5.2, 5.3, and 5.4.

Comment	
While the changes to Requirement R2 Parts 2.1.4 and 2.4.4 represent a significant improvement over the currently effective TPL-001-4, Peak has a concern related to the contingencies required for study for the outages considered in the Planning Assessment. The primary concern is the lack of continuity between planning and operations with regard to contingency analysis. Per these proposed requirements, P1 contingencies are the only contingency types required to be studied for the outage conditions. However, in the operations horizon several Transmission Operators (TOP) and Reliability Coordinators (RC) consider (and require reliable system performance for) contingencies more severe than single P1 contingencies, as specified in the RC's SOL Methodology for the Operations Horizon per FAC-011-3 Requirement R3.2, R3.3, and R3.3.1. These multiple contingencies might include certain P4, P5, or P7 multiple contingencies. If there are multiple contingencies that are required for assessment (and are required to meet performance criteria) in the operations horizon, then those same contingencies should be assessed for planned outages in the planning horizon. Excluding these contingencies from the Planning Assessments for the outage conditions creates a reliability gap between planning and operations. Under the existing language, the planner's assessment of the outages would only identify reliability problems associated with P1 contingencies, whereas, if the planners considered the same contingencies that are considered in operations, the reliability gap between planning and operations would be closed. Any identified reliability risks in the Planning Assessment would result in either rescheduling the outage or proposing solutions that could be passed on to operations. If multiple contingencies that are used in operations are not required for assessment in the planning horizon, then the outcome is an environment where operations is held to more stringent/conservative performance than planning. This presents increased reliability risks, it conflicts with good utility practice, and it detracts from the principle of "plan it like you intend to operate it, and operate it like you planned it." Furthermore, NERC Project 2015-09 (Establish and Communicate System Operating Limits) has proposed modifications to FAC-011-3 and FAC-014-2, and a new Reliability Standard FAC-015-1 that are aimed at improving the continuity between planning and operations. These proposed standards were posted for the 45-day formal comment period on 8/24/2018. The proposed FAC-011-4 Requirement R5 and subparts requires the RC in its SOL Methodology to identify any additional single contingencies (beyond P1 contingencies) or multiple contingency events for use in performing Operational Planning Analysis and Real-time Assessments and for identifying stability limits. If this standard passes ballot, then continuity between planning and operations would be further improved if TPL-001-5 R2 Parts 2.1.4 and 2.2.4 would require these same contingencies to be assessed as part of the Planning Assessment for outage conditions. Accordingly, Peak suggests that TPL-001-5 Requirement R2 Parts 2.1.4 and 2.4.4 require an assessment of not only P1 contingencies, but also the additional single contingencies and multiple contingencies identified in proposed FAC-011-4 Requirement R5 Parts 5.2, 5.3, and 5.4. It is possible that these more severe contingencies are unable to meet the performance criteria in Table 1 of TPL-001. This can be addressed by relaxing the performance criteria for these contingencies during prior outage conditions, where the assessments would only require that these contingencies demonstrate that instability, Cascading, or uncontrolled separation does not occur. Such a requirement actually provides even more alignment between planning and operations, considering proposed FAC-011-4 Requirements R6 parts 6.3 and 6.4 which stipulate that the performance criteria for contingencies more severe than single P1 contingencies are that the system demonstrates that instability, Cascading, or uncontrolled separation does not occur. Peak also has a concern with the language in TPL-001-5 R2 Parts 2.1.4 and 2.2.4 that states, "System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned." Peak believes that the "or" should be "and", thus requiring the outages to be assessed against both System peak conditions and against Off-Peak conditions. If the outages are not assessed against both System Peak and Off-Peak conditions, there is an increased risk that significant reliability issued could go undetected. Peak does not believe that the determination of using System Peak versus Off-Peak conditions for this analysis should rely on engineering judgement. Alternately, the System Peak and Off-Peak language could be removed and replaced with "the range of system conditions that the System is expected to experience during the outage."

The proposed removal of the six month minimum duration threshold for modeling planned outages introduces duplication of the studies currently performed in TOP-003 and IRO-017 Operational Planning Assessments. The IRO-017 standard establishes the outage coordination process within the operations planning horizon, which covers the period from day-ahead to one year out. The outage coordination process includes development and communication of outage schedules, evaluating impacts and developing operating plans to mitigate outage conflicts, or rescheduling outages when necessary in order to reduce the reliability impact of the critical outage. This process ensures a more accurate modeling of expected system conditions, including information on concurrent outages.

Removing Requirement 1, Part 1.1.2 makes sense as the base models should reflect the longer-term state of the system and not scheduled outages or contingency events. The changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4 are logical and allow for knowledgeable, technical rationale to determine which scheduled outages need to be analyzed. Note: references to "Near-Term Planning Horizon" should be replaced with the defined term from the NERC Glossary of Terms - "Near-Term Transmission Planning Horizon".

Comments: GTC agrees in principle with the changes to Requirement 2, Parts 2.1.4 and 2.4.4. However, we recommend the following format changes and minor content changes to clarify the requirements:

2.1.4 When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed.

2.1.4.1 These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner.

- Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.
- Known outage(s) shall not be excluded solely based upon outage duration.

2.1.4.2 This assessment shall include, at a minimum, known outages expected to produce more severe System impacts on the Planning Coordinator's or Transmission Planners's portion of the BES.

2.1.4.3 The assessment shall be performed for the P0 and P1 categories, identified in Table 1, for the System peak or Off-Peak conditions expected when the known outage(s) are planned.

2.4.4 When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed.

2.4.4.1 These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner.

- Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.
- Known outage(s) shall not be excluded solely based upon outage duration.

2.4.4.2 This assessment shall include, at a minimum, known outages expected to produce more severe System impacts on the Planning Coordinator's or Transmission Planners's portion of the BES.

2.4.4.3 The assessment shall be performed for the P1 categories, identified in Table 1, for the System peak or Off-Peak conditions expected when the known outage(s) are planned.

One additional comment is concerning the "documented outage coordination procedure or technical rationale" by which Planning entities determine the appropriate outages to be assessed. The SDT included the following statement in the technical rationale that accompanied this posting:

"The documented outage coordination procedure is intended to include consultation with the affected Reliability Coordinator, consultation with Transmission and/or Generator Owner(s) affected by the known outage, or application of documented outage coordination processes."

This is a reasonable assumption but it is important to note there is no requirement for operating entities to provide this type of information to planners for all planned outages. The method which an auditor would use to determine the adequacy of a planner's procedure/rationale is unclear, in instances where planning entities do not have access to operating plans as they are produced or changed

We propose the following alternative text for Part 2.1.4: "…for the P0 and P1 categories identified in Table 1 with expected System conditions when the known outage(s) are planned." Similarily we proposed the following alternate text for Part 2.4.4: "…for the P1 categories identified in Table 1 with expected System conditions when the known outage(s) are planned." The System peak or Off-Peak models will normally be suitable for the Part 2.1.4 and 2.4.4 requirements. However, explicitly requiring the assessment obligation to be based on only these models excludes the option of using other models that can represent the applicable system conditions more appropriately than the System peak or Off-Peak models.

Yes for R1.1.2 removal. - The removal is just fine, because it streamlines or simplifies R1 objective, and the sub-requirement that pertain to inclusion of known outages to near-term planning horizon cases will be addressed on future requirement R2.1.4 (for steady state) and R2.4.4 (transient stability), anyway.

Yes for R2.1.4 and R2.4.4. – The proposed requirement gives the TP the choice of selecting which known outages can be included in the assessment, which are primarily outages that may pose severe system impacts to the system only. These may prove to be helpful, because the focus of the study relies only on the selection and inclusion of known outages that may cause severe system impacts to the system.

Texas RE appreciates the Standards Drafting Team's (SDT) reconsideration of Requirement language to address the comments previously submitted by Texas RE. The changes to TPL-001-5 R2, Part 2.1.4 appear to address the circular issue of R1 pointing to R2 and R2 pointing to R1.

Texas RE still contends there should be a specific requirement for the Planning Coordinators and Transmission Planners to develop an outage coordination process with specific criteria. As currently drafted, Part 2.1.4 and Part 2.4.4 state known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure *or* (emphasis added) technical rationale by the Planning Coordinator or Transmission Planner. Texas RE's position is that a technical rationale is not sufficient and there is no Reliability Standard that requires Planning coordinators and Transmission Planners to develop an outage coordination procedure. IRO-017-1 R1 requires each Reliability Coordinator to develop, implement, and maintain an outage coordination process for generation and Transmission outages within its RC Area.

Texas RE previously submitted comments including proposed language to R1 that would require each Transmission Planner and Planning Coordinator to maintain System models that include known outages of generation or Transmission Facilities. Texas RE again recommends revising TPL-005 R1.1 as follows:

1.1 System models shall represent:

1.1.1. Existing Facilities;

1.1.2. Known outages(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected according to an established procedure or technical rationale that, at a minimum: 1.1.2.1 Establishes a criteria, supported by a technical justification, for identifying significant known outages based on MW or facility ratings; and 1.1.2.2. Does not exclude known outage(s) solely based upon the outage duration.

How does new 2.1.4 meet the SDT's belief stated in the Technical Rationale that there is an "implied need to strengthen the collaboration and consultation between the Reliability Coordinator and the planning entities at the outset of determining the known outages that should be assessed in the Near-Term Transmission Planning Horizon." What is the measurement of whether the Technical Rationale developed under 2.1.4 is acceptable – simply that is not based on duration of the outage? How does having a documented outage coordination procedure satisfy the need for performing TPL analysis? Most entities already have such a process that is totally unrelated to TPL analysis. While it may be implied, the documented outage coordination procedure does not explicitly state that any modeling or contingency analysis is required.

We maintain that the Contingency event that represents a 3 ph fault plus a failure of a non-redundant component of a Protection System remains a reliability concern and reiterate that the SDT's alternatives offered in Draft #1 and Draft #3 would address it: • Keep the 3ph fault + SPF in Protection System event in Table 1 Stability Performance Extreme Events, but require a Corrective Action Plan when Cascading is identified. • Move the 3 ph fault + SPF in Protection System event to Table 1 Steady State & Stability Performance Planning Events and create a new P8 category. The only System performance requirement that should apply to P8 is that Cascading shall not occur and a Corrective Action Plan should be required when Cascading is identified.	

The existing evaluation (except to separate breaker failure from the SPF in Protection System event) brings us back to square one.

Comment	
In the Extreme Events portion of Table 1, the use of the NERC defined term "Normal Clearing" is not sufficiently clear or could be misapplied. A composite protection system can be made up of redundant systems with significantly different clearing times. Failure within a redundant composite protection system can be interpreted as "Normal Clearing" based on the NERC definition of a "Misoperation". Using this definition, "Normal Clearing" would occur without providing clearing fast enough to meet stability requirements. Steady State and Stability Performance Extreme Events should be evaluated by simulating "worst case clearing time" of the composite protection system for the element(s) unless otherwise specified. The use of the term "Delayed Fault Clearing" in the Stability Items 2e through 2f of the Extreme Events portion of Table 1 could be interpreted differently based on the NERC definition of "Delayed Fault Clearing". The NERC definition of "Delayed Fault Clearing" seems to apply to failures of an entire composite protection system, whereas clearing occurs via breaker failure or some remote clearing after an intentional delay. Using this interpretation of the definition, the failure of a portion of a redundant system which results in a slower clearing time would not meet the definition of "Delayed Fault Clearing", but could still result in clearing that does not meet stability requirements. Stability Items 2e through 2f of the Extreme Events portion of Table 1 should be studied under conditions where failure of a non-redundant component results in "worst case clearing time" for the composite protection system of the element(s).

For the same reasons stated in question 2. BPA believes that removing Part 1.1.2 is appropriate. BPA does not feel that it is appropriate to incorporate it under R2. The system assessment process and the outage process are separate and distinguishable processes that should not be dependent on each other for purposes of compliance. BPA's preference would be for the planned outages process to be in a new standard entitled Long Range Outage Coordination Process. If this is not feasible, due to being outside the scope of the project, BPA would like to see two new requirements created for known outages planned for steady state analysis and known outages planned for stability analysis. It may make sense to create new subrequirements under R3 and R4 respectively, or have them be stand alone requirements. BPA is ok with the content of the requirement, just not the location of the requirement.

MISO supported the changes previously proposed by the SDT to create the P8 contingency. Given that a Corrective Action Plan is needed to address instability or cascading resulting from a three-phase fault and subsequent failure of a non-redundant protection system component, the best way to achieve this requirement is through the creation of a P8 contingency rather than extreme events. Therefore, MISO agrees with the proposed P8 event. MISO would also support expanding the P5 contingency definition to include both a phase-to-ground fault and a three-phase fault as well should the Standard Drafting Team prefer to expand the P5 contingency definition rather than establish a new P8 event. The aspects of the current TPL-001-4 and proposed TPL-001-5 standards that address the area of planned maintenance outages mischaracterize the role of transmission planning – which is to provide for an orderly transmission expansion program that ensures the transmission system is adequate, reliable, robust and resilient at all times in the future given the lead times associated with making necessary system improvements. Adequacy, reliability, robustness, and resilience include the flexibility of a transmission system to allow for the planned outage of any single transmission facility during non-peak periods in a manner that i) does not require the curtailment of firm load and ii) provides for the system to be operated in an N-1 secure state after the single transmission facility has been removed from service for planned maintenance or other purposes. All transmission facilities require planned outages from time-to-time to facilitate maintenance and repair work that cannot be performed hot, to facilitate capital upgrades to the transmission system or other facilities in the vicinity of the transmission facility, or for other purposes. Therefore, the eventual occurrence of a future planned outage on a transmission facility is certain and “known”, not “hypothetical”, only the timing and duration of the future outage could be considered uncertain or “hypothetical”. If the transmission system is not planned in a manner that allows for any single facility to be removed for maintenance under non-peak conditions, then the system will not maintain the necessary adequacy, robustness and flexibility to accommodate maintenance requirements in general. In FERC Order 786, the Commission indicated the following at PP 41: “We agree with commenters such as MISO and ATCLLC that certain elements may be so critical that, when taken out of service for system maintenance or to facilitate a new capital project, a subsequent unplanned outage initiated by a single-event could result in the loss of non-consequential load or may have a detrimental impact to the bulk electric system reliability. A properly planned transmission system should ensure the known, planned removal of facilities (i.e., generation, transmission or protection system facilities) for maintenance purposes without the loss of non-consequential load or detrimental impacts to system reliability such as cascading, voltage instability or uncontrolled islanding.” (emphasis added) It is “known” that every transmission facility will eventually need to be taken out of service for planned maintenance or other purposes, thus the proper planning approach to planned maintenance outages should be to ensure that the transmission system is planned with sufficient robustness and resilience to accommodate the planned maintenance flexibility during off-peak periods that will be required regardless of whether or not such activity has been scheduled at the time the planning assessment is conducted. While some have argued that outages can be fully managed by outage coordination efforts focused on the operating horizon, if the system is not planned and expanded to maintain sufficient adequacy and robustness to support future outages, the outage coordination functions may be backed into a corner where there is no choice but to shed load to accommodate a planned outage (which is generally considered unacceptable) or deny an outage given the inability of the outage coordination function to make the necessary system upgrades in the operating horizon that should have been made by the planning function within the planning horizon. An important function of planning is to support operations, which includes ensuring the system is adequate and robust enough to provide flexibility to the outage coordination function to schedules planned outages when they are needed without sacrificing reliability or load continuity. A proposed remedy would be to expand the P3 and P6 contingency definitions to evaluate an additional multiple outage scenario with no load loss. This scenario would include a planned outage, system adjustments, and then a contingency, but no consequential or non-consequential load loss would be allowed for the planned outage element, and no non-consequential load loss would be allowed for the contingent element. This contingency definition, which would be applicable only for non-peak conditions where planned maintenance is normally performed, could be

implemented as a P2.1 contingency, followed by system adjustments (but no load shed), followed by a P1 contingency. With this new contingency added, the system would be planned to accommodate the planned outage of any one system element (transmission or generation element) during off-peak periods while ensuring the system can continue to operate in a manner that is N-1 secure with no non-consequential load loss. Use of the P2.1 contingency as the maintenance contingency ensures continuity of service to load for the maintenance outage, which aligns with how the system would be operated. This change to the standard ensures that there is a minimal level of flexibility to provide for the planned outage of any single element in the system, which better aligns with the overall goal of transmission planning to ensure the system is adequate, robust, resilient, and reliable in the future.

The standard should be revised to represent the true intent for this standard, which is to hold the PC and TP accountable for assessing the state of the transmission system under specific scenarios, determine deficiencies, and act to correct those deficiencies. Requirements outside of the control of the TP are not an effective tool to determine if the intent of those requirements has been met. The TP can only assume that transmission equipment outages that represent a future timeframe (year one or year two), have been submitted by the entity requesting the outage, and are correct.

See proposed changes to Requirements 1 (Part 1.1.2) and 2 (Parts 2.1.4 and 2.4.4) above.	

Clarification in needed on 'Table-1 – Extreme Events Second Column Stability Item 2f'.

This should be changed to 3-phase close-in fault on Transmission circuit with failure of a non-redundant component of a Protection System result in Delay Fault Clearing.

The FERC Order 754 study only looked at close-in line and bus faults with remote clearing. For end of line 3-phase faults, fault detection is unlikely with a failure of a non-redundant battery due to in-feed effect. It is not possible to run a stability study with this indeterminate state. The requirement as written will require installation of redundant batteries or battery monitors at all BES substations. If this is the case corrective action plans may take years to complete. Given the low probability of a battery failure concurrent with a 3-phase end of line fault, was this the intent of the standard? Also, for end of line faults can credit be given for the chargers ability to trip?

TVA believes that the proposed changes to Footnote 13d creates a significant cost impact for a very small probability event. TVA believes that the proposed changes to Requirement 2, Parts 2.1.4 and 2.4.4 would add no value and create siginificant new effort and time to duplicate operations studies.

.

Please see comments in question 1 and 2 above.

Additional Comment for consideration, related to Requirement #4 (related to clarification of the Standard):

Requirement 4.1 states that “Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1…..” Immediately after 4.1, sub-requirements 4.1.1 through 4.1.3 specify specific system/generator stability performance requirements which are not mentioned in Table 1. Our observation is that Table 1 includes steady state and stability related performance requirements. This apparent placement of performance requirements in more than one location within the Standard document is confusing. Recommendation for consideration is to move sub-requirements 4.1.1 through 4.1.3 to Table 1.

Additional Comment for consideration, related to clarification of the Standard:

Regarding Table 1, if the performance requirements (steady state / stability) are not being met, AND, if Table 1 indicates that non-consequential load loss and interruption of Firm Transmission Service are allowed, is a specific corrective action plan required as per Requirement 2.7 (assuming that non-consequential load loss and/or interruption of Firm Transmission Service would allow for meeting the performance requirements)? This question relates to a scenario where Footnote 12 does not apply. A general recommendation is to clarify within the standard whether or not a specific corrective action plan is required to be documented, as per Requirement 2.7, in the Planning Assessment for this scenario (i.e. performance requirements are not being met and Footnote 12 does not apply).

Comment	
NV Energy feels it is prudent to require a corrective action plan resulting from a three-phase fault and subsequent failure of a non-redundant protection system component, and should therefore not be considered an extreme event, but rather a planning event. NV Energy did not agree with the changes previously proposed by the SDT to create a new P8 contingency, but would support expanding the P5 event to include a three phase fault or a L-G fault, or replacing the L-G fault type with a three phase fault.

Please see comments in question 2 above regarding known outages. The current title of the technical rationale document is misleading as it could be interpreted as the technical rationale for single points of failure only, instead of TPL-001-5 as a whole. We request that the title of the technical rationale be changed to “TPL-001-5 Technical Rationale.” The language in 2.1.5 should be modified to align with 2.4.5 as shown below: *When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.* Additionally, per the SDT’s response to the last round of comments submitted, please add language in the technical rationale to clarify on what is meant by the spare equipment strategy. For reference, below were the comments submitted – *Does “spare equipment strategy” mean the existence of at least a single spare for major transmission equipment that has a lead time of more than one year; and does Requirement 2.4.5 imply that the existence of such a spare would eliminate the need to assess the impact of the possible unavailability of such equipment on System performance? If so, then Requirement 2.4.5 should be written this way.* *As currently written, Requirement 2.4.5 lacks clarity. Every reasonable “spare equipment strategy” for equipment with a lead time of one year or more could result in the unavailability of such equipment; it is a matter of probability. For example, an Entity with 100 large power transformers could have*	

a spare transformer strategy of maintaining one system spare. However, it is possible that two transformers could fail during time span of one year. With only one spare, the Entity would be exposed to operating the system for up to one year with one less transformer than designed. Even if the Entity has four (4) spares, it is still possible that five (5) transformers could fail during one year (albeit with much lower probability), which would leave the Entity similarly exposed. Greater clarity is required for Requirement 2.4.5, as is more criterion development.

The addition of new single point of failure of selected non-redundant Protection System Components to the P5 contingency event category seems appropriate. Elimination of the P8 contingency event category and moving the new single point of failure of selected non-redundant Protection System Components to the Extreme Events category seems appropriate. The language in Footnote 13 is still a concern, as noted in ATC's comments on Question 1 above.

ITC thanks the SDT for their work on developing this revision to the TPL-001 and agrees with the work they have done so far. ITC does not believe though that the language for the Requirements 3.5 and 4.5 for the evaluation of the non-redundant component of a protection scheme goes far enough. While it does require industry to evaluate the consequences of the configurations, it does not require a Corrective Action Plan be developed for any significant affect to the transmission system. ITC believes a CAP should be required.

4. Do you agree with the proposed implementation plan?	
Douglas Johnson - American Transmission Company, LLC - 1	
Answer	No
Document Name	
Comment	
The first timeframe following FERC's approval of TPL-001-5 needs to be 5 years, rather than 3 years, to perform all the required tasks (e.g., make model changes; develop the new Footnote 13 contingencies; perform the new known outage, long lead time, P5, and Extreme event analyses; and develop CAPs for non-P5 contingency system deficiencies). The timeframes of 2 years and 4 years to complete the other required tasks seem acceptable.

The SSRG notes that after the 48-month implementation sunset provision has expired, the implementation plan will not provide an entity with sufficient time to implement a Corrective Action Plan (CAP) identified in future annual planning cycles. For example, a CAP that identifies a facility that will require longer than one year to construct will not be in-service by the next annual planning cycle, which will impact the Planning Coordinator's (PC) the ability to meet the Table 1 performance requirements for the next annual planning assessment. In other words, an unintended and unavoidable consequence of the requirement may be a violation of R2.7 through no fault of the PC performing the annual study and preparing the CAP. A solution to the issue would be to include an exception in Section 2.7.3 or create a new Section 7.2.4 that alleviates the need to meet the Table 1 performance metrics for subsequent planning assessments when P5 events identify a capital project as a CAP and no other mitigation can be achieved. The exception would be extended until the capital project can be placed into operation.

Mark Holman - PJM Interconnection, L.L.C. - 2	
Answer	No
Document Name	
Comment	

- PJM planning procedures do not allow for redispatch to address reliability criteria violations. Based on this, PJM has some concerns regarding requirements to fully implement Corrective Action Plans in accordance with the identified schedule. As the RTO, PJM does not have control over the construction schedule, and relies on individual Transmission Owner to complete construction and implement enhancements by the required in service date detailed in the Corrective Action Plan.

- The sentence "The first annual Planning Assessment shall be completed in accordance with TPL-001-5, but without CAPSs for revised P5, by this date." in Figure 1 of the Implementation Plan could use some clarification. PJM in concerned that the sentence implies that revised P5 events, while not requiring a CAP, still need to be included in the Planning Assessment at the t+36 Point on the timeline. PJM Proposes the following revisions to clarify that revised P5 events are not required for inclusion in the assessment during this first 36 month period: “The first annual Planning Assessment (excluding revised p5 events), shall be completed in accordance with TPL-001-5, but without CAPs for revised p5, by this date.”

Duke Energy does not support the proposed Implementation Plan. Without knowing at this time the potential size and scope of the work that will be necessary for implementing the CAPs, we cannot agree on the 48 month portion of the Implementation Plan. These corrective actions will likely involve improvements to protection systems for BES elements and these require system outages to critical lines that are only made available during low-load periods that will extend the overall time required to complete the CAP. We disagree with assigning an implementation period to an unknown scope of work. We suggest the SDT consider a flexible Implementation Plan with phases that can be assessed depending on the size and scope of work.

It would be better for the first timeframe to be 4 or 5 years, rather than 3 years, from FERC approval of TPL-001-5 to make the model changes, develop the new contingency files, perform the additional analysis, and developing CAPs for non-P5 contingency system deficiencies. The second timeframe of 2 years and third timeframe of 4 years to complete the other required tasks seem acceptable.

While the implementation timelines to study and develop CAPs are reasonable, TVA does not agree with the implementation timeline for completing CAPs to address the modified P5 events. These changes will require extensive work in order to make protection systems completely redundant for these events, requiring switch houses in some cases. If several switch houses are required, the proposed implementation plan would not provide adequate time to coordinate extensive outages and complete the corrective action plans.

The implementation plan profides sufficient time to perform studies and coordinate CAPs with external entities to meet compliance with TPL-001-5.

Texas RE appreciates the SDT's attempt to clarify the implementation plan and the timeline provided is helpful. Texas RE recommends explicitly saying which requirements are applicable in the Compliance Date and Initial Performance date sections. Based on the words written (not on the visual timeline), Texas RE understands the IP as follows:

- First calendar quarter 36 months following regulatory approval.
  - The effective date of the standard is the first day of the first calendar quarter 36 months following the effective date of the applicable governmental authorities order approving the standard. This date serves as a starting point for the implementation plan.
  - In accordance with the Initial Performance section, applicable entities must complete the planning assessment without CAPs by the effective date of the standard, or 36 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes there is no requirement mentioned. **In the interest of clarity and not being vague Texas RE strongly recommends the implementation plan specify which requirement this date refers to.**
  - 60 months following regulatory approval.
    - In accordance with the Initial Performance section, applicable entities must develop any required CAPs under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13, items b, c, and d, or 36 months plus 24 months, or 60 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes this is also indicated in the Compliance Date section, **which is redundant and could cause confusion**.
  - 108 months following regulatory approval
    - In accordance with the Compliance Date section, for CAPs developed to address failures to meet Table 1 performance requirements for the p5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d, or 36 plus 72, or 108 months following the effective date of the applicable governmental authority's order approving the standard.

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 754 and Order No. 786?

Sandra Shaffer - Berkshire Hathaway - PacifiCorp - 6	
Answer	No
Document Name	
Comment	
PacifiCorp believes that the proposed revisions to TPL-001-4 to model known outages with a duration of less than six months in the annual Planning Assessment are not a cost effective way of meeting FERC directives in Order No. 786 as these studies are already being performed in TOP-003 and IRO-017 Operational Planning Assessments. PacifiCorp agrees that the proposed revisions to TPL-001-4 along with the Implementation Plan are a cost effective way of meeting FERC directives in Order No. 754 addressing reliability issues associated with single points of failure in protection systems.

BPA believes that the revision to the standard and the implementation plan do not adequately address industry concerns about the costs needed to plan and construct a project for a planned maintenance outage of short duration. Those planned maintenance outages will be coordinated ahead of time according to outage planning processes. It is not cost effective to plan and construct a project for a planned maintenance outage of short duration when planned outages of the same facility are not expected again in the foreseeable outage planning timeframes. Requiring a low-probability, single-point-of-failure of protection systems to be analyzed as a Planning Event is beyond prudent planning. The proposed changes could be a very-significant burden on Planning and Engineering staffs to investigate and identify “non-redundant” components of a Protection System. The proposed changes to the standard would require industry to protect against rare three-phase faults coupled with protection system failure. This should remain as an extreme event and allow the TP or PC to decide whether mitigating possible Cascading is cost effective. The cost effectiveness document falls short of providing any substantive cost effectiveness analysis and is more like a repeat of the proposed changes to the requirements & footnote 13.

FERC directives, cost effective or not, are a direct order of action which in accordance with the directive, if the directives determine that transmission system deficiencies exist being detrimental to state of the transmission system, those deficiencies should be acted on and corrected. Allowing more time (+12 months to all milestones) for the implementation as a result of these changes, may minimize the financial impact.

TVA does not believe the proposed changes to Footnote 13d are a cost effective approach. Redundancy of DC control circuitry will result in significant station upgrades or, in many instances, require the construction of new switch houses. TVA believes there is not an economic justification of Footnote 13d based on the historical failure rate of DC control circuitry.

Comment

While the proposed revisions to TPL-001-4 along with the Implementation Plan may be a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754 in terms of corrective action plans, the proposed revisions will present a very significant burden on Planning and Engineering staffs to investigate and identify “non-redundant” components of a Protection System. This incremental burden will have adverse cost impacts.

See comments in Question 1 regarding the acceptability of backup protection or Composite Protection System if they provide acceptable System performance. It is not cost effective to require the costlier installation of fully identical redundant primary protection when the primary protection happens to be faster and trip fewer Elements than acceptable backup protection or a Composite Protection System.

It is unclear what evidence would be sufficient to demonstrate compliance with Footnote 13. An onerousFor example, the assembly of sufficient evidence of redundant control circuitry for an audit may involve the compilation of hundreds of station schematic drawings, wiring drawings, and photos, beside description documents that may be needed to explain the substation evidence. Sufficient evidence to demonstrate redundant communications and DC supplies may be similarly burdensome.

The proposed addition of “non-redundant” components of a Protection System, in particular Footnotes 13.b. and 13.d., to this Standard may add significant resource and financial burden to Transmission Owners (TOs) that in all cases may not provide a benefit to BES reliability. Although a planning standard, the Requirements as proposed may indirectly result in TOs expanding internal “design” standards to implement redundant Protection Systems on all transmission facilities regardless of the impact on BES reliability. As an alternative approach, the SDT could consider addressing the FERC directives by expecting planning assessments be performed with the assumption that all Protection Systems are non-redundant, and then when concerns are identified, the entity would confirm that there is a redundant Protection System in place or develop a CAP to address the non-redundant Protection System. Other than increasing the scope of the planning assessments, this type of process to investigate concerns as they are identified, might eliminate the initial administrative burden on collecting detailed Protection System information and building models with sufficient detail and accuracy. It would also avoid the unintended consequence of TOs upgrading all transmission facilities with non-redundant Protection Systems, regardless of the impact on BES reliability.

ITC does not believe it is cost effective to study the consquences of non-redundant protection devices and not require a CAP for these scenarios should their affect on the transmission system be significant and detrimental. ITC believes if the results of a study of these types of events show this, a CAP should be required.

ATC has concerns about that current Implementation Plan and cost-effectiveness of the proposed revisions to TPL-001-4. The current proposed language for Footnote 13 leaves uncertainty in applicability and potential gaps in studies through the use of exemptions, as noted in ATC's comments on Question 1 above. Furthermore, the uncertainty in the amount evidence to prove redundancy and/or monitoring has the potential to be a significant work effort. Regarding studies that are to be performed, the proposed TPL-001-5 standard and Implementation Plan are cost-effective, with the exception being the first 3-year timeframe of the Implementation Plan, as noted in ATC's comments on Question 4 above.

Comment	
The proposed revision and 9-year implementation plan may be a reasonable way of meeting the FERC directive. However, MH feels that the analysis and mitigation of 115 kV and 138 kV stations is burdensome and likely expensive without necessarily improving overall BES reliability. As a result, we propose the following: 1. Implementing a risk based assessment to identify critical facilities of concern rather than making full protection redundancy a bright line requirement for all BES facilities.	

2. For P5 definition of HV limit should be considered from 200 to 299kV.

GENERAL COMMENT

MH will be unable to adopt this standard as a NERC standard based on legislative restrictions in Manitoba. However, changes proposed in TPL-001-5 that are acceptable to MH would be adopted in a future Manitoba standard, MH-TPL-001-5.

We believe that meeting FERC Order 786 has nothing to do with cost effectiveness. While we agree with the concept of requiring redundant system protection elements only where they are needed, per Order 754, the process of having system protection engineers perform analysis for each BES facility to determine clearing times for failures of non-redundant system protection elements is burdensome and will require significant additional man-hours.

Additional comments received from Mike Smith - Manitoba Hydro (via attachment link in the comment report)

MH recommends the following changes to the footnote 13 of Table 1 (new text in red, removed text in green strikeout).

b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (except a single communications system that is both monitored and reported at a Control Center shall ~~not~~ be considered ~~non-~~redundant);

c. A single station dc supply and it's DC distribution circuits associated with protective functions required for Normal Clearing (except a single station dc supply and it's DC distribution circuits that is both monitored and reported at a Control Center for both low voltage and open circuit shall ~~not~~ be considered ~~non-~~redundant);

d. A single ~~control~~ trip circuitry ~~(including auxiliary relays and lockout relays)~~ associated with protective functions, from the ~~dc supply~~ protection relay through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except a single trip circuit and coil that is both monitored and reported at a Control Center shall ~~not~~ be considered ~~non-~~redundant).

e. A single auxiliary tripping or lockout relay associated with protection tripping;

Rationale:

In footnote-13c, it is not clear whether or not monitoring is a satisfactory way to address only the SPF of the main supply (batteries and main bus) or also of the various branch circuits involved in DC distribution. The proposed changes allow for monitoring exceptions for DC Distribution and components of the trip circuit which are low probability items for failure similar to the previous exceptions permitted for DC supplies, communications and trip coils. We would also like to propose to put auxiliary trip relays and lockout relays on their own line to make it 100% clear that they must be considered in a SPF analysis.

Comments received from Jeremy Voll - Basin Electric Power Cooperative (via attachment link in the comment report)

Questions

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

   ☐ Yes

   ☒ No

   Comments: Please consider the following:

   Remove the double negative wording in 13.b, 13.c, and 13.d to make it clearer and less complicated with wording like, "shall be considered redundant".

   Add wording like, "Backup protection or a Composite Protection System is an acceptable alternative to a fully identical redundant protection if it provides acceptable System performance." at the end of Footnote 13. A statement like this needs to be in the standard. Otherwise, it can be disregarded in an audit. In addition, replace the "Clarification: Is backup clearing redundant?" section on page 3 of the Technical Rationale with a different question and discussion like the following:

   Clarification: "When is backup protection or a Composite Protection System acceptable as an alternative to fully identical redundant protection?"

   If backup protection or a Composite Protection System (defined in PRC-004) provides acceptable System performance when a component of the primary Protection System fails, then fully identical redundant protection is unnecessary. Backup protection or a Composite Protection System may result in delayed clearing in comparison to a primary Protection System and trip additional Elements (refer to the NERC definition of Delayed Clearing and Normal Clearing Times). However, if any of these protection alternatives result is acceptable System performance, then fully identical redundant protection is unnecessary. If one of these protection alternatives already exist, then no Corrective Action Plan is needed. Or if one of these protection alternatives is effective, then it could be used as a suitable Corrective Action Plan in lieu of a fully identical redundant Protection System.

The terms and application of the terms in Footnote 13 do not appear to be consistent with those used in PRC-004 standard and the definition of Delayed Clearing and Normal Clearing Times in the NERC Glossy of Terms. The wording in the standard and the Technical Rationale should include and discuss the terms, Delayed Clearing and Normal Clearing Times and Composite Protection System and be consistent with them.

Add other statements at the end of Footnote 13 to clarify and confirm key matters in the TPL-001 standard so that it cannot be disregarded in an audit. The proposed wording for these statements are the following:

- “Voltage and current sensing devices of a Protection System are not considered.” Discussion of this matter is only in the Technical Rationale (p. 4) right now.
- “Protective relays (such as sudden pressure relays or thermal temperature relays) that do not respond to electrical quantities shall not be considered redundant”. Discussion of this matter is only in the Technical Rationale (p. 5) right now
- “The reclosing relays of a Protection System are not considered.” This matter is not presently discussed in the Technical Rationale.
- “Two communication systems must use separate communication paths (e.g. not be the same power line carrier line, same OPGW, same microwave tower, or same tone path, etc.) to be considered redundant. A SONET ring shall be considered redundant.” This matter is not presently discussed in the Technical Rationale.
- “Control circuitry includes everything from the DC supply through and including the trip coils, as well as auxiliary and lockout relays. A trip coils with monitoring do not need to be redundant.” This matter is not presently discussed in the Technical Rationale.

Remove the single communication system exemption when a system is monitored and reported to a Control Center. This exemption exposes Transmission Operators (TOPs) to potential noncompliance with TOP-001 (and TOP-002 if the communication failure condition continues into the next operating day). In the real time environment, TOPs must respond to the loss of communication until that pathway is repaired. Under the definition of Real Time Assessment, which is used in TOP-001, TOPs must operate within all SOLs for the topology that exists at that moment, which explicitly includes the status of protection systems. With the loss of protective function communication, the delayed clearing due to a SLG fault could cause an unacceptable system stability performance deficiency. TOPs do not have real-time stability analysis tools to keep checking pre-contingency for potential unacceptable system stability and appropriate new/temporary SOLs. Removal of the exemption would result in planning horizon analysis of non-redundant communication failures and corrective actions when unacceptable stability performance is found. Therefore, removal of the exemption would reduce the risk of TOPs being noncompliant with TOP-001 and TOP-002.

2. Do you agree with the removal of Requirement 1, Part 1.1.2 and changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4, in order to meet the FERC directive in Order No. 786?

☒ Yes

☐ No

Comments:

The revisions appear to address both the FERC and industry issues and concerns.

3. Do you agree with the proposed revisions to TPL-001-4?

☒ Yes

☐ No

Comments:

4. Do you agree with the proposed implementation plan?

☐ Yes

☒ No

Comments:

It would be better for the first timeframe to be 4 or 5 years, rather than 3 years, from FERC approval of TPL-001-5 to make the model changes, develop the new contingency files, perform the additional analysis, and developing CAPs for non-P5 contingency system deficiencies. The second timeframe of 2 years and third timeframe of 4 years to complete the other required tasks seem acceptable.

5. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost-effective way of meeting the FERC directives in Order No. 754 and Order No. 786?

☐ Yes

☒ No

Comments:

See comments in Question 1 regarding the acceptability of backup protection or Composite Protection System if they provide acceptable System performance. It is not cost effective to require the costlier installation of fully identical redundant primary protection when the primary protection happens to be faster and trip fewer Elements than acceptable backup protection or a Composite Protection System.

It is unclear what evidence would be sufficient to demonstrate compliance with Footnote 13. An onerousFor example, the assembly of sufficient evidence of redundant control circuitry for an audit may involve the compilation of hundreds of station schematic drawings, wiring drawings, and photos, beside description documents that may be needed to explain the substation evidence. Sufficient evidence to demonstrate redundant communications and DC supplies may be similarly burdensome.

Comments received from Chris Scanlon – Exelon (via attachment link in the comment report)

Questions

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

☐ Yes

☒ No

Comments: For clarity of purpose the double-negatives should be removed from 13b, 13c, and 13d. Consider: "…*that is both monitored and reported at a Control Center shall ~~not~~ be considered ~~non-~~redundant)"*

Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

AEP remains concerned by the increased complexity of P5 due the expansion of footnote 13. As written, this footnote requires one to consider a variety of scenarios, including backup zone 2 clearing of a transmission line for pilot relay or pilot communication failure, a breaker failure scenario initiated by trip coil failure (often the same as P4), or remote clearing of a station such as would occur upon a non-redundant bus differential failure.

In order to avoid having to evaluate zone of protection clearing times for every conceivable protection outage condition and document the “consideration” of each of the sub-items under footnote 13, AEP suggests a more generalized P5 event description by adding the text “or Remote (Delayed) Fault Clearing.” As a result, it would then read: “Delayed Fault Clearing ***or Remote (Delayed) Fault Clearing*** due to the failure of a non-redundant component of a Protection System protecting the Faulted element to operate as designed, for one of the following: 1. Generator, 2. Transmission Circuit, etc.”

This would continue to make use of the existing glossary term…

Delayed Fault Clearing – Fault clearing consistent with correct operation of a breaker failure protection system and its associated breakers, or of a backup protection system with an intentional time delay.

This existing term covers zone 2 backup clearing of transmission lines as well as being duplicative of P4 CB failure scenarios. As a result, a new definition is necessary to cover a gap:
Remote (Delayed) Fault Clearing – Fault clearing necessary to be accomplished at stations one removed from a faulted station bus or other faulted station equipment as a consequence of a protection system single point of failure at the faulted station.

This new term is necessary because relays may not be set with an intentional time delay for clearing remote station faults, and remote clearing may be necessary for non-redundant bus differential schemes. Whether “Delayed” is included in this new term may be

immaterial since, while clearing times may be long, there may be no intentional delay, just inherent delay. Footnote 13 could then removed from the draft standard, and instead, be added to the technical supplement to the standard. The would explain the possible causes of delayed clearing or remote delayed clearing, instead of rigorously having to be part of the standard and introducing what we would regard as unnecessary compliance burdens.

The SDT appreciates your feedback. While the SDT recognizes that Footnote 13 has become more detailed as a result of the proposed revisions motivated by the SPCS/SAMS "Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" report recommendations, the SDT does not believe it has become unnecessarily complex. On the contrary, the SDT considers that the proposed revisions to Footnote 13 has brought increased attention to assessment concerns that pre-existed in TPL-001-4 and has clarified considerations about non-redundant components of a Protection System, while facilitating flexibility in addressing the non-redundant components of a Protection System reliability concerns. The SDT appreciates the suggestion to propose a new NERC Glossary of Terms definition, but believe this is unnecessary given the existing definitions of Normal Clearing and Delayed Fault Clearing. To the point, the SDT considers that the "intentional delay" included in the Delayed Fault Clearing definition is both intentional and inherent to the design of backup protection. The SDT has added additional narrative to the Technical Rationale to clarify this topic. The SDT has suggested potential approaches to addressing the challenges of coordinating considerations regarding non-redundant components of a Protection System between planning and protection personnel in the Technical Rationale. Thank you, again, for your comments.

Comment	

Footnote 13 is unnecessary. The available powerflow software doesn't simulate protection system equipement (relays, communication systems, dc supplies or control circuitry). The software simulates the transmission network. A protection system failure is simulated by making assumptions about the system's response to the failure and then simulating it. Adding specific equipment to the standand does change the simulation. Without actual protection equipment in the model, it falls on the engineer to make the correct assumptions when doing the simulations. As it should be.

Response	
The SDT appreciates your feedback. The SDT disagrees that Footnote 13 is unnecessary and considers its continued existence is consistent with the SPCS/SAMS "Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" report recommendations. The SDT agrees that appropriate and accurate fault magnitude and clearing times, as well as sequencing and causality of tripped equipment are key to properly simulating the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Moreover, the SDT considers that Footnote 13 directs the personnel performing the required assessment to which non-redundant components of a Protection System should be considered when formulating the proper simulation assumptions. Thank you, again, for your comments.

The phrase "comparable Normal Clearing times" is not consistent with the existing definition of "Normal Clearing" found within the Glossary of Terms Used in NERC Reliability Standards. Additionally, "comparable Normal Clearing times" is not sufficiently clear to allow consistent interpretation for purposes of enforcing the standard.	
Likes 0	

Dislikes 0	
Response	
The SDT appreciates your feedback. The SDT considers that Footnote 13 reference to Normal Clearing times is wholly consistent with the NERC Glossary of Terms definition and clearly refers to the time normally expected with proper functioning of the installed protection system that operates as designed to clear a fault. The SDT considers that the usage of “comparable” in Footnote 13 offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System. Additionally, the SDT intent in using comparable in Footnote 13 is explained in the Technical Rationale. Thank you, again, for your comments.	
Terry BIlke - Midcontinent ISO, Inc. - 2	
Answer	No

Comment	
Footnote 13 does not include all of the applicable single points of failure addressed by 754, such as instrument transformers, and in some cases, includes aspects that do not represent single points of failures, such as redundant breaker trip coils. With regard to breaker trip coils, the lack of two trip coils in a circuit breaker increases the potential for a breaker failure issue (P4), but does not create a relay failure issue since the absence of redundant trip coils would not prevent initiation of breaker failure for failure of a single trip coil.

Response	
The SDT appreciates your feedback. The SDT has specifically addressed the omission of voltage or current sensing devices from Footnote 13 in the Technical Rationale, consistent with the SPCS/SAMS “Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request” report and recognizing that these devises have a lower level of risk of failure to trip due to robustness and likelihood to actually cause tripping upon failure.	

The SDT has emphasized that trip coils, as well as all other parts of the single control circuitry associated with protective functions from the dc supply required for Normal Clearing should be included during consideration whether a single control circuitry is a non-redundant component of a Protection System. This emphasis is intended to highlight that a SPF in the single control circuitry, regardless of which part of the single control circuitry is the SPF, may cause the single control circuitry to not operate to operate for Normal Clearing and, thus, must be properly simulated as a Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. A substantial treatment of the single control circuitry is made in the Technical Rationale, as well as specific discussion about Table 1 Planning Events P4 versus P5. Additional language about single and dual trip coils has been added to the Technical Rationale. Thank you, again, for your comments

Comment	
TVA agrees with the contents of Footnote 13a, b, and c. However, TVA believes Footnote 13d represents a significant cost impact for a very small probability event. Redundancy of DC control circuitry will result in significant station upgrades or, in many instances, require the construction of new switch houses. TVA believes there is not an economic justification of Footnote 13d based on the historical failure rate of DC control circuitry.

Response	
The SDT appreciates your feedback. The SDT considers that Footnote 13d is consistent with the SPCS/SAMS "Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" report recommendations. The SDT considers that the probability of failure for a non-redundant component of a Protection System should not be confused with the severity of failure to meet System performance requirements of Table 1. The SDT has emphasized in the Technical Rationale that Footnote 13 directs which non-redundant components of a Protection System should be considered when simulating the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Footnote 13 does not prescribe a level of redundancy for the System, nor does it prescribe	

Corrective Action Plans for non-redundancy. To the point: the Table 1 Planning Event P5 prescribes the required System performance given failure of a non-redundant components of a Protection System. The SDT considers that the proposed Footnote 13d offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System for simulation as the Table 1 Planning Event P5. Thank you, again, for your comments.

Comment	
Footnote 13a:	

The word "comparable" in footnote 13a requires additional clarification. The Technical Rationale contains conflicting explanations of what is meant by "comparable Normal Clearing times". In the "Clarification: Is backup protection redundant?" section it appears that a secondary relay would not be considered redundant as the clearing times are not exactly the same as the primary relay. However, in the section titled "Clarification: What is comparable and what is not comparable for purposes of footnote 13?" it appears that slightly slower secondary relaying would be considered redundant if its results in "fault clearing within the expected Normal Clearing time period and isolate the fault by tripping similar System Elements". LES recommends modifying the Technical Rationale to clarify the drafting team's intent or else consider modifying footnote 13a to instead state "...that provides comparable Normal Clearing times **(e.g. piloted primary relay and non-piloted secondary relay with different Normal Clearing times)"** to ensure comparable isn't mistaken to mean having identical Clearing times.

Footnote 13c:

Is it the Standard Drafting Team's intent to consider all substations that don't have either open circuit monitoring on a single battery bank or two battery banks as non-redundant? LES feels the lack of open circuit monitoring as described in footnote 13c is too restrictive to consider a single station DC supply as non-redundant. Although the Technical Rationale section titled "Clarification: Is a battery charging system appropriate redundancy for the battery?" indicates a battery charger "may not be of sufficient power to source current necessary to operate one or more breakers", LES feels the individual utility should be permitted to analyze each substation configuration to determine if an open circuit does in fact constitute a non-redundant DC supply.

Additionally, is it the Standard Drafting Team's intent that non-redundant DC supply be modeled as an entire substation outage? This seems to be the case based on the statement "prevent the operation of all local protection" within the section titled "Clarification: Why are DC supplies addressed?". However, this is not realistic during an open circuit or low voltage situation as the relays would still be operational and only the backup protection for one line or bus section would operate during a transmission line fault. Additionally, the open circuit monitoring requirement seems unnecessary as PRC-005 provides adequate testing for open circuits. Based on this, LES recommends "open circuit" be excluded from the footnote or else additional detail added to allow for analysis of substation configuration and DC supply capability during an open circuit condition.

Response

The SDT appreciates your feedback. The SDT considers that the usage of "comparable" in Footnote 13 offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System. Additionally, the SDT intent in using comparable in

Footnote 13 is explained in the Technical Rationale. While the SDT disagrees that the Technical Rationale describes comparable Normal Clearing times as needing to be identical, the SDT has added a clarification section to the Technical Rationale to clarify this point.

The SDT revised Footnote 13c consistent with the SPCS/SAMS "Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" report recommendations. The SDT considers that the revisions to Footnote 13c allow sufficient flexibility in addressing the non-redundant components of a Protection System reliability concerns. The SDT has addressed this topic, as well as Footnote 13c considerations of open-circuit dc supply extensively in the Technical Rationale.

Thank you, again, for your comments.

Comment	

Comments: Please consider the following:

Remove the double negative wording in 13.b, 13.c, and 13.d to make it clearer and less complicated with wording like, "shall be considered redundant".

Add wording like, "Backup protection or a Composite Protection System is an acceptable alternative to a fully identical redundant protection if it provides acceptable System performance." at the end of Footnote 13. A statement like this needs to be in the standard. Otherwise, it can be disregarded in an audit. In addition, replace the "Clarification: Is backup clearing redundant?" section on page 3 of the Technical Rationale with a different question and discussion like the following:

Clarification: "When is backup protection or a Composite Protection System acceptable as an alternative to fully identical redundant protection?"

If backup protection or a Composite Protection System (defined in PRC-004) provides acceptable System performance when a component of the primary Protection System fails, then fully identical redundant protection is unnecessary. Backup protection or a Composite Protection System may result in delayed clearing in comparison to a primary Protection System and trip additional Elements (refer to the NERC definition of Delayed Clearing and Normal Clearing Times). However, if any of these protection alternatives result is acceptable System performance, then fully identical redundant protection is unnecessary. If one of these protection alternatives already exist, then no Corrective Action Plan is needed. Or if one of these protection alternatives is effective, then it could be used as a suitable Corrective Action Plan in lieu of a fully identical redundant Protection System.

The terms and application of the terms in Footnote 13 do not appear to be consistent with those used in PRC-004 standard and the definition of Delayed Clearing and Normal Clearing Times in the NERC Glossy of Terms. The wording in the standard and the Technical Rationale should include and discuss the terms, Delayed Clearing and Normal Clearing Times and Composite Protection System and be consistent with them.

Add other statements at the end of Footnote 13 to clarify and confirm key matters in the TPL-001 standard so that it cannot be disregarded in an audit. The proposed wording for these statements are the following:

- "Voltage and current sensing devices of a Protection System are not considered." Discussion of this matter is only in the Technical Rationale (p. 4) right now.
- "Protective relays (such as sudden pressure relays or thermal temperature relays) that do not respond to electrical quantities shall not be considered redundant". Discussion of this matter is only in the Technical Rationale (p. 5) right now
- "The reclosing relays of a Protection System are not considered." This matter is not presently discussed in the Technical Rationale.
- "Two communication systems must use separate communication paths (e.g. not be the same power line carrier line, same OPGW, same microwave tower, or same tone path, etc.) to be considered redundant. A SONET ring shall be considered redundant." This matter is not presently discussed in the Technical Rationale.
- "Control circuitry includes everything from the DC supply through and including the trip coils, as well as auxiliary and lockout relays. A trip coils with monitoring do not need to be redundant." This matter is not presently discussed in the Technical Rationale.

Remove the single communication system exemption when a system is monitored and reported to a Control Center. This exemption exposes Transmission Operators (TOPs) to potential noncompliance with TOP-001 (and TOP-002 if the communication failure condition continues into the next operating day). In the real time environment, TOPs must respond to the loss of communication until that pathway is repaired. Under the definition of Real Time Assessment, which is used in TOP-001, TOPs must operate within all SOLs for the topology that exists at that moment, which explicitly includes the status of protection systems. With the loss of protective function communication, the delayed clearing due to a SLG fault could cause an unacceptable system stability performance deficiency. TOPs do not have real-time stability analysis tools to keep checking pre-contingency for potential unacceptable system stability and appropriate new/temporary SOLs. Removal of the exemption would result in planning horizon analysis of non-redundant communication failures and

corrective actions when unacceptable stability performance is found. Therefore, removal of the exemption would reduce the risk of TOPs being noncompliant with TOP-001 and TOP-002.

Response
The SDT appreciates your feedback. The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear. The SDT intent has been described extensively in the Technical Rationale. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT asserts that consideration of non-redundant components of a Protection System is necessary to properly simulate the Table 1 Planning Event P5 for the purpose of assessing whether required System performance is achieved. If, after proper consideration and simulation, required System performance is achieved, then there may be no impetus to make non-redundant components of a Protection System redundant. On the other hand, if after proper consideration and simulation it is demonstrated that required System performance is not achieved, making non-redundant components of a Protection System redundant may be but one of many alternatives for corrective actions to obtain required System performance. The SDT has revised Footnote 13 to be explicit about what non-redundant components of a Protection System shall be considered; the SDT disagrees that it is necessary to specify equipment that need not be considered in Footnote 13. The equipment omitted from Footnote 13 consideration is described in the Technical Rationale. Additionally, revisions to the Technical Rationale to address items such as reclosing circuitry and trip coils have been affected. The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which

Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5.

Thank you, again, for your comments.

The Technical Rationale does not clarify whether two communication systems must use to separate communication paths (e.g. not the same power line carrier line, single OPGW, microwave tower, tone path, etc.) to qualify as non-redundant systems. The Technical Rationale does not clarify whether control circuitry must use separate paths (e.g. not the same control panel, wire tray, etc.) to qualify as non-redundant circuitry.

Response	
The SDT appreciates your feedback. The SDT has revised Footnote 13 to be explicit about what non-redundant components of a Protection System shall be considered. The SDT considers that this, along with supporting material in the Technical Rationale, are sufficient for the applicable entities to conduct their own considerations of their own Protection System details for the purpose of assessing Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Thank you, again, for your comments.

Duke Energy requests further clarification on the use of the term “monitoring” in Footnote 13 item b. Is it the drafting team’s intent, that “monitoring” should be continuous in nature, or would a once a day “check back” of the protection system meet the drafting team’s intent for monitoring? More clarification is needed on this point.

We believe that the current draft of Footnote 13 is reasonable and will lower reliability risk. To avoid confusion, we suggest eliminating the use of double negative statements in Footnote 13. Therefore we suggest changing the phrase “shall not be considered non-redundent” to “shall be considered redundant” at the end of the sentence for 13b, 13c, and 13d.

The term “comparable Normal Clearing times” as stated in 13.a. may cause inconsistent interpretation between entities and auditors as to what is considered comparable. Consider replacing “…without an alternative that provides comparable Normal Clearing times” with wording used in the Technical Rationale such as “…without an alternative that clears the fault within the time period expected if the single protective relay (that is simulated to fail as a SPF) were to function properly.”

Consider replacing the double negative wording in 13.b, 13.c and 13.d ("shall not be considered non-redundant") with "shall be considered redundant."

We suggest that the term "shall not be considered non-redundant" be removed in subsections b), c), and d). Also, we suggest changing the term "except" to "unless" for the three sections. In d), regarding control circuitry, we suggest the following language change: *(unless a single trip coil that is both monitored and reported at a Control Center if it is the only single point of failure in the control circuitry).*

Response	
The SDT appreciates your feedback. The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear. The SDT has emphasized that trip coils, as well as all other parts of the single control circuitry associated with protective functions from the dc supply required for Normal Clearing should be included during consideration whether a single control circuitry is a non-redundant component of a Protection System. This emphasis is intended to highlight that a SPF in the single control circuitry, regardless of which part of the single control circuitry is the SPF, may cause the single control circuitry to not operate to operate for Normal Clearing and, thus, must be properly simulated as a Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. A substantial treatment of the single control circuitry is made in the Technical Rationale, as well as specific discussion about Table 1 Planning Events P4 versus P5. Additional language about single and dual trip coils has been added to the Technical Rationale. Thank you, again, for your comments.

We agree with the rational and contents of footnote 13 except for the exception for non-redundant communication equipment that is monitored and alarmed in 13b. Our concern with this exception is that teleprotection equipment that is part of a communication system may be in a failed state and not always generate an alarm.

The SDT appreciates your feedback. The SDT considers that the proposed Footnote 13b offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System for simulation as the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. The SDT agrees with the respondent that a single communications system associated with protective functions necessary for correct operation of a communication-aided protection scheme required for Normal Clearing that is not monitored and reported at a Control Center should not be considered redundant. Thank you, again, for your comments.	
Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - MRO, Group Name SPP Standards Review Group	
Answer	No
Document Name	
Comment	

The SPP Standards Review Group (SSRG) recommends the Standards Drafting Team (SDT) provide clarity on the statement "for Normal Clearing". NERC defines "Normal Clearing" as a situation where "[a] protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems."

If a communications system associated with protective functions is installed to provide faster tripping than required, does this fall into the "Normal Clearing" definition? If so, the installed communications system associated with protective functions to clear faults faster than necessary is a single point of failure.

The SSRG recommends the SDT consider adding language to the technical rationale document that explains the inclusion of the communication system associated with protective functions as a single point of failure.

Comment

No. Westar Energy and Kansas City Power & Light Co. suggest that in Footnote 13d, single lockout relays that are monitored and report to a Control Center should be afforded the same exception as single trip coils that are monitored and reported to a Control Center. Without the exception, the number and/or complexity of studies are unnecessarily increased with little benefit to reliability. The companies offer the following revision: d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except **when either** a single trip coil **or a single lock out relay** is both monitored and reported at a Control Center shall not be considered non-redundant)

Likes 0	
Dislikes 0	

Response
The SDT appreciates your feedback. The SDT did struggle with the topic of giving similar monitoring and reporting exceptions to auxiliary and lockout relays. While relay monitoring (e.g., relay trouble indication) may be adequate to announce when a lockout or auxiliary relay may have failed, it is not clear that relay monitoring is sufficient for identifying all possible relay modes of failure that may lead to Delayed Fault Clearing. Additionally, the SPCS/SAMS “Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request” report specifically included auxiliary relays and lockout relays as DC control circuitry protection system attribute, noting that these devices are generally unmonitored and may remain in a failed state undetected for an extended period. Further, auxiliary and lockout relay failures in certain Protection System designs can be much more detrimental, leading to significantly Delayed Fault Clearing, than expected for the failure of a trip coil. For these reasons, the SDT chose not to exclude monitored and reported auxiliary relays and lockout relays when considering the control circuitry as a non-redundant component of a Protection System. Thank you, again, for your comments.

Comment	

American Transmission Company (ATC) has concerns about the application and consistency of terms used in Footnote 13 compared to those used in other standards and the NERC Glossary of Terms, specifically Delayed Clearing and Normal Clearing Times. Reliability Standard PRC-004 introduced the term "Composite Protection System," whose definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. A failure of a Protection System component is not a Misoperation if the performance of the Composite Protection System is correct. A slower than typical operation of a Composite Protection System is considered a Misoperation if the delay results in the operation of at least one other Element's Composite Protection System. Normal Clearing Time of a Composite Protection System in the context of this standard could be interpreted as the clearing time of the slower of the redundant systems, as long as this clearing time does not result in the operation of another Element's Composite Protection Systems and acceptable system performance for the scenarios outlined in Footnote 13. However, such guidance or interpretation is currently missing from the Standard or Technical Basis.

In addition, ATC has concerns regarding the application of Footnote 13. Specifically, although monitoring of communication equipment has the potential to reduce the exposure to risk of delayed tripping, it does not eliminate the risk. By not requiring the analysis of delayed clearing on lines lacking redundant communication in the Planning Horizon, ATC (and other companies) may not identify transmission lines that need redundant communication to maintain generator or system stability. During a communication failure event, real-time operations is required to study the impact of delayed clearing for SLG or three- phase faults and mitigate any issues. This particular real-time requirement is maintained in the recent draft standards under Project 2015-09 Establish and Communicate System Operation Limits. It is not clear why the planning study requirements do not align with the operation requirements and require advance study of the same concern. Furthermore, this exemption presents a real risk to the system reliability. The Footnote 13 language transfers identification of this reliability risk into the real-time environment, where the tools used to identify dynamic instability do not typically exist. Regardless of whether the event actually occurs, the proposed Footnote 13 language creates a gap in the standards and exposes registered Transmission Operators to potential non-compliance under TOP-001 (and TOP-002, if the communication failure condition continues into the next operating day) for having failed to identify a stability related SOL and then operated the system to that limit.

In the real-time environment, ATC must respond to the loss of communication until that pathway is repaired. Under the definition of Real Time Assessment, which is used in TOP-001, ATC must operate within all System Operating Limits (SOLs) for the topology that exists at that moment, which explicitly includes the status of Protection Systems. With the loss of communication for a particular path, delayed clearing could exist for a fault and the response of the system or nearby generation may not be stable. Real-time tools would not identify the instability, and ATC would not identify the SOL to which it should have been operating. Identification of these issues should occur in the System Planning domain, where it then can be passed through to the Transmission Operator in accordance with FAC-014. The

Planning environment has sufficient time to consider these scenarios to help ensure that the instability is corrected, whether that corrective action is a system reconfiguration or a new system or generator limitation for that condition.

There are additional opportunities to align terminology between PRC-005 and TPL-001 if the Standard Drafting Team continues with the use of a monitoring and alerting exemption. Some examples include "Control Center" versus "location where corrective action can be initiated" and "Open-Circuit" versus "battery continuity." Furthermore, the standard fails to address what is an acceptable monitoring period that could be used for non-redundancy or time in which corrective action would be required. Some devices are monitored in-real time, while others test less periodically, including once a day or monthly. Finally, the standard as currently written fails to address those systems that are part of non-battery-based systems.

The use of double negatives in Footnote 13 is confusing (e.g., not considered non-redundant). Consider modifying the wording of the P5 requirement to Fault plus failure of a component of a Composite Protection System which results in remote and/or delayed clearing. In this context, delayed clearing would be a delay beyond the slower of redundant systems as described above. The footnote could be simplified to state that components to be considered include protective relays, communication systems, DC supply, and control circuitry associated with the protective functions.

The redundancy of communication paths needs to be addressed. Consider the following clarification, “Communication systems are considered fully redundant if, for any single component failure such as power line carrier equipment, microwave tower, tone path, or OPGW, one communication system remains fully functional.”

ATC is concerned about the impact of mitigation of single station DC failures for stations without open circuit monitoring. Monitoring reduces the exposure to risk but cannot mitigate it. While monitoring and alerting systems are starting to become available within the industry, from ATC's perspective, they are not widely implemented. The result would be any BES facility without redundant DC supplies being tested for P5 bus section contingencies will result in delayed clearing. For the sites that fail this scenario, ATC would elect for redundant DC supplies due to future concerns about the true "redundancy" of monitored equipment. The result would likely mean building new control houses at significant cost due to space constraints at existing facilities.

Finally, it is unclear as to what the appropriate evidence would be to demonstrate compliance with Footnote 13. There is no indication of what evidence type would be required to demonstrate that entities have redundancy or monitoring. Verification of redundancy of control circuitry could drive assembly of a significant number of station drawings, inventories, and other pieces of evidentiary documentation to prove redundancy. This verification has the potential to be extremely burdensome for both the industry and audit staff.

Response

The SDT appreciates your feedback. The SDT intent has been described extensively in the Technical Rationale. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT has added treatment of the comparable Normal Clearing times principle to the Technical Rationale.

The SDT considers that the proposed Footnote 13b offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System for simulation as the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. The SDT agrees with the respondent that a single communications system associated with protective functions necessary for correct operation of a communication-aided protection scheme required for Normal Clearing that is not monitored and reported at a Control Center should not be considered redundant.

The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5, does not believe that somehow Footnote 13 transfers identification of reliability risks associated with non-redundant components of a Protection System to any other Reliability Standard.

The SDT considers that Footnote 13 is consistent with the SPCS/SAMS “Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request” report recommendations.

The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear.

Thank you, again, for your comments.

The SDT appreciates your feedback. The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear.	

The SDT intent has been described extensively in the Technical Rationale. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT asserts that consideration of non-redundant components of a Protection System is necessary to properly simulate the Table 1 Planning Event P5 for the purpose of assessing whether required System performance is achieved. If, after proper consideration and simulation, required System performance is achieved, then there may be no impetus to make non-redundant components of a Protection System redundant. On the other hand, after proper consideration and simulation it is demonstrated that required System performance is not achieved, making non-redundant components of a Protection System redundant may be but one of many alternatives for corrective actions to obtain required System performance. The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5. Thank you, again, for your comments.

Answer	Yes
Document Name	
Comment	
Footnote 13 items “b”, “c”, and “d” contain the parenthetical language “(except […] that is both monitored and reported at a Control Center shall not be considered non-redundant)”. It can be argued that monitoring and reporting these quantities at a Control Center does not adequately address the potential failure of these systems when called upon to act. I.e., just because the monitoring and reporting at a Control Center indicates that these systems are functional does not necessarily mean that they will function properly when called upon. There should be no argument that redundancy in items “b”, “c”, and “d” is more reliable than SPFs that are monitored at a Control	

Center; however, Peak can accept the risk-based decision and justification that, as quoted in the rationale document, “components that may be SPF but are monitored and reported to a Control Center exhibited lower risk on par with being redundant, and therefore did not warrant P5 Event simulation.”

The contents of Footnote 13 now provide additional clarification of Requirement expectations as it relates to non-redundant Protection Systems. However, including this level of detail in planning assessments raises concerns:

1. Is consideration of the Protection System details even possible or practical given the state of available information and modelling tools?

2. Does the complexity of the resulting models and planning assessments create an increased opportunity for incorrect results?

3. Will it essentially create a new "design" standard that will lead to increased protection system redundancy for all transmission facilities regardless of the impact on BES reliability. 4. By considering the conditions for monitoring Protection System components (e.g. trip coil, DC Supply, etc.), there is an indirect impact on existing Requirements included in PRC-005, which also consider component monitoring when establishing maintenance periodicity.

While ITC generally supports the current content of Footnote 13, we would suggest the following addition. Update Footnote 13d to exclude the wiring to and from the trip coil, in addition to a single trip coil when required for Normal Clearing where it is monitored and reported. Suggested update, "A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except a single trip coil and wiring that is both monitored and reported at a Control Center shall not be considered non-redundant)."

2. Do you agree with the removal of Requirement 1, Part 1.1.2 and changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4, in order to meet the FERC directive in Order No. 786?

Gregory Campoli - New York Independent System Operator - 2	
Answer	No
Document Name	
Comment	
The NYISO agrees that the removal of Req. 1, Part 1.1.2 will still meet the objective of FERC Order No. 786. We do not agree with the changes to Req. 2, Parts 2.1.4 and 2.4.4. We believe the assessment should be performed for all contingencies listed in Table 1, since all such contingencies are studied in the Operations Horizon. Not including all Table 1 contingencies in Req. 2 introduces a gap between the Near-term Planning and Operations Horizon assessments, poetentilally leading to a reliability gap. Other proposed NERC Standards, such as FAC-011-3, FAC-014-2, and FAC-015-1 are proposed to, among other things, improve the coordination between Planning and Operations. The proposed revisions here seem contrary to that intent.

Comment

We find the new language difficult to interpret. We provide the following comments for consideration to make the requirements more succinct:

The language seems to indicate a new procedure, or an edit to an existing procedure is required. We do not think the requirement should stipulate a new or modification to a procedure. We suggest revising the requirement as follows (applicable to both 2.1.4 and 2.4.4):

When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages expected to produce more severe System impacts on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with outage coordination procedure(s) or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. Past or current studies may be used to support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

Additionally, the following sentence could be removed from the requirement and added to the technical rationale: *Past or current studies may be used to support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1."* The new Requirement – R2 parts 2.1.4 / 2.4.4 – is open ended and may result in Transmission Planners (TP) performing almost a "real-time" operations analysis (i.e., what is the impact of this outage / what about that outage) in-lieu of designing the Bulk Electric System (BES), which is the purpose of TPL-001. NERC IRO-017 *Outage Coordination*, which purpose states "*To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon*", was established for this purpose, and the proposed TPL-001 change would represent a spillover from IRO-017.

Comment	
We find the new language difficult to interpret, and possibly redundant. We provide the following suggestions for consideration to make the requirements more succinct. The documented outage coordination procedure or technical rationale should cover the rationale for outage selection. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known	

outage(s) shall be selected for assessment consistent with a

documented outage coordination procedure or technical rationale by

the Planning Coordinator or Transmission Planner. Known outage(s)

shall not be excluded solely based upon outage duration. The

assessment shall be performed for the P0 and P1 categories identified

in Table 1 with the System peak or Off-Peak conditions that the System

is expected to experience when the known outage(s) are planned. Past or current studies may

support the selection of known outage(s), if the study(s) has

comparable post-Contingency System conditions and configuration

such as those following P3 or P6 category events in Table 1.

Additionally –

The new Requirement – R2 parts 2.1.4 / 2.4.4 – is open ended and may result in Transmission Planners (TP) performing almost a "real-time" operations analysis in-lieu of designing the Bulk Electric System (BES), which is the purpose of TPL-001. NERC IRO-017 Outage Coordination, which purpose states "To ensure that outages are properly coordinated in the Operations Planning time horizon and Near-Term Transmission Planning Horizon", was established for this purpose, and the proposed TPL-001 change would represent a spillover from IRO-017.

IRO-017 R4 states:

Each Planning Coordinator and Transmission Planner shall jointly develop solutions

with its respective Reliability Coordinator(s) for identified issues or conflicts with

planned outages in its Planning Assessment for the Near-Term Transmission Planning

Horizon. The intent and requirements of IRO-017-1 R4 and proposed TPL-001-5 R2 parts 2.1.4 / 2.4.4 seem to overlap, potentially causing confusion.

TVA does not agree with the proposed revision. These studies are already performed in the operational arena, therefore there is no benefit in recreating this analysis in the planning horizon. If issues were found in the planning horizon, the corrective action(s) would be to forego the outage or to create an operating guide. The operational cases have a more accurate near-term load/generation profile which are more appropriate for these studies. Recreating these studies in the planning horizon would add no value, but take siginificant new effort and time to complete. Outages in the planning horizon should be studied by the TP, while those in the operations horizon should be studied by the TOP.

In our opinion, any known/planned outages of major equipment for maintenance or construction should be included in the appropriate models to be assessed for P0-P7 planning events. Therefore, Requirement 1, Part 1.1.2 needs to be retained except for the words “with a duration of at least six months”.

We propose alternative language to Part 1.1.2 as follows:

"Known outage(s) of generation or Transmission Facility (ies) scheduled in the Planning Horizon."

Modification to Part 1.1.2, as proposed above, would also allow the last bullet of Part 2.1.3 to remain as an option for a sensitivity study.

We disagree with the language proposed for new Part 2.1.4. We disagree with the phrase “selected known outages” (line 2) as we believe this is not the intent of the Commission to pick and choose which planned outages should be assessed. We disagree with the development of a "documented coordination procedure" (line 5) as Transmission Planners and Planning Coordinators do not coordinate outages. Instead, we believe that a documented methodology or collection process to obtain the outages scheduled in the Planning Horizon needs to be developed. We disagree that the proposed assessment shall be performed for only the P0 and P1 planning events (lines 8 and 9), as we do not believe these analyses are sufficient to identify areas for non-consequential load loss during times of maintenance outages. We believe that if the changes to Part 1.1.2 are included as proposed above, then much, if not all, of the proposed Part 2.1.4 can be eliminated, which would be an enhancement to the standard.

As the FERC expressed in paragraph 42 of its Order 786, "The Commission's directive is to include known generator and transmission planned maintenance outages in planning assessments, not hypothetical planned outages." In our opinion, the language included at the end of Part 2.1.4

(lines 13-16) regarding "Past or current studies may support the selection of known outage(s) …" continues to support the idea of developing hypothetical or speculative outages based on previous analysis of Table 1 Planning Events P1-P7. Clearly this does not meet the intent of the Commission to include only planned maintenance outages, and in our opinion goes well beyond the directive.

If Part 2.1.4 is to remain, we propose that the language be changed to something similar to the following:

"When known generator and transmission maintenance outages are planned in the Near-Term Planning Horizon, the impact of these maintenance outages shall be assessed. The known outages included in the models shall be supported with a documented outage collection methodology/procedure or technical rationale for inclusion developed by the Transmission Coordinator or Transmission Planner."

Our concerns for Part 2.1.4 also apply to Part 2.4.4. For the reasons stated above, we cannot support the changes proposed by the SDT to meet the FERC directive.

Response

The SDT appreciates your feedback. The SDT considers that the current approach meets the FERC directives and the SAR of this SDT. The SDT notes that the FERC directive states that outages with a duration of less than 6 months could have a greater impact than those longer than 6 months. The SDT also notes that it considered a bright line of less than 6 months however the SDT ultimately decided that any duration chosen wouldn't be appropriate for every registered entity. The current draft provides the flexibility to determine which known outages have an impact and to study those in the near term planning horizon.

Comment

As indicated in the Applicability section of TPL-001, applicability of this requirement falls on the PC and the TP. It should be noted that the TP does not own transmission assets under the TP fuction registration. Holding a TP accountable for knowing outage status of equipment in a planning model is nonsenscial. The outage of transmission equipment is determined by those entities requesting the outage, where the burden of proof should fall on the applicable entities providing data for building models under MOD-032-1 and not the TP. As noted in R1, planning models "shall represent projected System conditions"; the TP does not have full visibility of these projected system conditions, but expects that data submitted for building of the planning models, in accordance with MOD-032-1, is as accurate as the system being projected in each of the respective planning models.

Additionally, the proposed TPL-001-5 Draft 4 language "These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration." Should be removed, since the TP does not own transmission assets.

Moving the requirement for Order No. 786 to Requirement 2 is fine. However, MISO does not agree with the characterization of planned maintenance with respect to the role of transmission planning – which is to provide for an orderly transmission expansion program that ensures the transmission system is adequate, reliable, robust and resilient at all times in the future given the lead times associated with making necessary system improvements. This is more fully described in the response to question 3 below.

NIPSCO believes any potential issues associated with planned maintenance outages are best identified through operational studies such as real time, next-day, and seasonal analysis rather than through the annual TPL-001-4 system performance analysis. Planned maintenance outages are almost always of short duration and are commonly scheduled to avoid occurrence during critical peak seasons. Only planned maintenance outages which are reasonably expected to occur during critical peak seasons, such as those six months or longer, should be included in the annual TPL-001-4 system performance analysis. Removing the existing six month threshold for planned maintenance outages and continually reducing the time of duration requires the analysis of an ever greater number of concurrent generator and line outages beyond any specified in the TPL-001-4 standard including (P2) bus+breaker fault, (P4) stuck breaker, and (P7) common tower. This moves the performance analysis requirements of the TPL-001-4 standard closer to an effective N-2 requirement, which is currently an Extreme event, which was never intended.

BPA believes that removing Part 1.1.2 is appropriate. BPA does not feel that it is appropriate to incorporate it under R2. The system assessment process and the outage process are separate and distinguishable processes that should not be dependent on each other for purposes of compliance. BPA's preference would be for the planned outages process to be in a new standard entitled Long Range Outage Coordination Process. If this is not feasible, due to being outside the scope of the project, BPA would like to see two new requirements created for known outages planned for steady state analysis and known outages planned for stability analysis. It may make sense to create new subrequirements under R3 and R4 respectively, or have them be stand alone requirements. BPA is ok with the content of the requirement, just not the location of the requirement.

We maintain that Planning Assessments and Operations Planning shall be coordinated. As currently proposed, the TPL standard only requires P1 events to be simulated when assessing planned outages in the Near-Term Transmission Planning Horizon. However, this is inconsistent with existing standards FAC-011-3 R3 and FAC-014-2 R6, which require the Reliablity Co-ordinator (RC) also to consider multiple contingencies when assessing these outages. Therefore, at a minimum, when the Planning Co-ordinator is assessing planned outages occurring in the Near Term Transmission Planning Horizon, they should simulate the contingencies that the RC would simulate when assessing and approving these outages, otherwise operations is held to more stringent/conservative performance than planning. Moreover, NERC Project 2015-09 (Establish and Communicate System Operating Limits) has proposed modifications to FAC-011-3 and FAC-014-2, and a new Reliability Standard FAC-015-1 that are aimed at improving the coordination between planning and operations. The proposed FAC-011-4 R5 requires the RC in its SOL Methodology to identify any additional single contingencies (beyond P1 contingencies) or multiple contingency events for use in performing Operational Planning Analysis and Real-time Assessments and for identifying stability limits. Hence, in order to improve this coordination between planning and operations and to eliminate any potential reliability gaps between these plans, the IESO proposes that TPL-001-5 Requirement R2 Parts 2.1.4 and 2.4.4 should require at least the same contingencies to be assessed as part of the Planning Assessment for outage conditions as the ones identified in proposed FAC-011-4 Requirement R5 Parts 5.2, 5.3, and 5.4.

Comment

While the changes to Requirement R2 Parts 2.1.4 and 2.4.4 represent a significant improvement over the currently effective TPL-001-4, Peak has a concern related to the contingencies required for study for the outages considered in the Planning Assessment. The primary concern is the lack of continuity between planning and operations with regard to contingency analysis. Per these proposed requirements, P1 contingencies are the only contingency types required to be studied for the outage conditions. However, in the operations horizon several Transmission Operators (TOP) and Reliability Coordinators (RC) consider (and require reliable system performance for) contingencies more severe than single P1 contingencies, as specified in the RC's SOL Methodology for the Operations Horizon per FAC-011-3 Requirement R3.2, R3.3, and R3.3.1. These multiple contingencies might include certain P4, P5, or P7 multiple contingencies. If there are multiple contingencies that are required for assessment (and are required to meet performance criteria) in the operations horizon, then those same contingencies should be assessed for planned outages in the planning horizon. Excluding these contingencies from the Planning Assessments for the outage conditions creates a reliability gap between planning and operations. Under the existing language, the planner's assessment of the outages would only identify reliability problems associated with P1 contingencies, whereas, if the planners considered the same contingencies that are considered in operations, the reliability gap between planning and operations would be closed. Any identified reliability risks in the Planning Assessment would result in either rescheduling the outage or proposing solutions that could be passed on to operations. If multiple contingencies that are used in operations are not required for assessment in the planning horizon, then the outcome is an environment where operations is held to more stringent/conservative performance than planning. This presents increased reliability risks, it conflicts with good utility practice, and it detracts from the principle of "plan it like you intend to operate it, and operate it like you planned it."

Furthermore, NERC Project 2015-09 (Establish and Communicate System Operating Limits) has proposed modifications to FAC-011-3 and FAC-014-2, and a new Reliability Standard FAC-015-1 that are aimed at improving the continuity between planning and operations. These proposed standards were posted for the 45-day formal comment period on 8/24/2018. The proposed FAC-011-4 Requirement R5 and subparts requires the RC in its SOL Methodology to identify any additional single contingencies (beyond P1 contingencies) or multiple contingency events for use in performing Operational Planning Analysis and Real-time Assessments and for identifying stability limits. If this standard passes ballot, then continuity between planning and operations would be further improved if TPL-001-5 R2 Parts 2.1.4 and 2.2.4 would require these same contingencies to be assessed as part of the Planning Assessment for outage conditions. Accordingly, Peak suggests that TPL-001-5 Requirement R2 Parts 2.1.4 and 2.4.4 require an assessment of not only P1 contingencies, but also the additional single contingencies and multiple contingencies identified in proposed FAC-011-4 Requirement R5 Parts 5.2, 5.3, and 5.4.

It is possible that these more severe contingencies are unable to meet the performance criteria in Table 1 of TPL-001. This can be addressed by relaxing the performance criteria for these contingencies during prior outage conditions, where the assessments would only require that these contingencies demonstrate that instability, Cascading, or uncontrolled separation does not occur. Such a requirement actually provides even more alignment between planning and operations, considering proposed FAC-011-4 Requirements R6 parts 6.3 and 6.4 which stipulate that the performance criteria for contingencies more severe than single P1 contingencies are that the system demonstrates that instability, Cascading, or uncontrolled separation does not occur.

Peak also has a concern with the language in TPL-001-5 R2 Parts 2.1.4 and 2.2.4 that states, "System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned." Peak believes that the "or" should be "and", thus requiring the outages to be assessed against both System peak conditions and against Off-Peak conditions. If the outages are not assessed against both System Peak and Off-Peak conditions, there is an increased risk that significant reliability issued could go undetected. Peak does not believe that the determination of using System Peak versus Off-Peak conditions for this analysis should rely on engineering judgement. Alternately, the System Peak and Off-Peak language could be removed and replaced with "the range of system conditions that the System is expected to experience during the outage."

The proposed removal of the six month minimum duration threshold for modeling planned outages introduces duplication of the studies currently performed in TOP-003 and IRO-017 Operational Planning Assessments. The IRO-017 standard establishes the outage coordination process within the operations planning horizon, which covers the period from day-ahead to one year out. The outage coordination process includes development and communication of outage schedules, evaluating impacts and developing operating plans to mitigate outage conflicts, or rescheduling outages when necessary in order to reduce the reliability impact of the critical outage. This process ensures a more accurate modeling of expected system conditions, including information on concurrent outages.

Removing Requirement 1, Part 1.1.2 makes sense as the base models should reflect the longer-term state of the system and not scheduled outages or contingency events. The changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4 are logical and allow for knowledgeable, technical rationale to determine which scheduled outages need to be analyzed. Note: references to “Near-Term Planning Horizon” should be replaced with the defined term from the NERC Glossary of Terms - “Near-Term Transmission Planning Horizon”.

Comments: GTC agrees in principle with the changes to Requirement 2, Parts 2.1.4 and 2.4.4. However, we recommend the following format changes and minor content changes to clarify the requirements:

2.1.4 When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed.

2.1.4.1 These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner.

- Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.
- Known outage(s) shall not be excluded solely based upon outage duration.

2.1.4.2 This assessment shall include, at a minimum, known outages expected to produce more severe System impacts on the Planning Coordinator's or Transmission Planners's portion of the BES.

2.1.4.3 The assessment shall be performed for the P0 and P1 categories, identified in Table 1, for the System peak or Off-Peak conditions expected when the known outage(s) are planned.

2.4.4 When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed.

2.4.4.1 These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner.

- Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.
- Known outage(s) shall not be excluded solely based upon outage duration.

2.4.4.2 This assessment shall include, at a minimum, known outages expected to produce more severe System impacts on the Planning Coordinator's or Transmission Planners's portion of the BES.

2.4.4.3 The assessment shall be performed for the P1 categories, identified in Table 1, for the System peak or Off-Peak conditions expected when the known outage(s) are planned.

One additional comment is concerning the "documented outage coordination procedure or technical rationale" by which Planning entities determine the appropriate outages to be assessed. The SDT included the following statement in the technical rationale that accompanied this posting:

"The documented outage coordination procedure is intended to include consultation with the affected Reliability Coordinator, consultation with Transmission and/or Generator Owner(s) affected by the known outage, or application of documented outage coordination processes."

This is a reasonable assumption but it is important to note there is no requirement for operating entities to provide this type of information to planners for all planned outages. The method which an auditor would use to determine the adequacy of a planner's procedure/rationale is unclear, in instances where planning entities do not have access to operating plans as they are produced or changed

We propose the following alternative text for Part 2.1.4: "…for the P0 and P1 categories identified in Table 1 with expected System conditions when the known outage(s) are planned." Similarily we proposed the following alternate text for Part 2.4.4: "…for the P1 categories identified in Table 1 with expected System conditions when the known outage(s) are planned." The System peak or Off-Peak models will normally be suitable for the Part 2.1.4 and 2.4.4 requirements. However, explicitly requiring the assessment obligation to be based on only these models excludes the option of using other models that can represent the applicable system conditions more appropriately than the System peak or Off-Peak models.

Yes for R1.1.2 removal. - The removal is just fine, because it streamlines or simplifies R1 objective, and the sub-requirement that pertain to inclusion of known outages to near-term planning horizon cases will be addressed on future requirement R2.1.4 (for steady state) and R2.4.4 (transient stability), anyway. Yes for R2.1.4 and R2.4.4. – The proposed requirement gives the TP the choice of selecting which known outages can be included in the assessment, which are primarily outages that may pose severe system impacts to the system only. These may prove to be helpful, because the focus of the study relies only on the selection and inclusion of known outages that may cause severe system impacts to the system.

Texas RE appreciates the Standards Drafting Team's (SDT) reconsideration of Requirement language to address the comments previously submitted by Texas RE. The changes to TPL-001-5 R2, Part 2.1.4 appear to address the circular issue of R1 pointing to R2 and R2 pointing to R1.

Texas RE still contends there should be a specific requirement for the Planning Coordinators and Transmission Planners to develop an outage coordination process with specific criteria. As currently drafted, Part 2.1.4 and Part 2.4.4 state known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure *or* (emphasis added) technical rationale by the Planning Coordinator or Transmission Planner. Texas RE's position is that a technical rationale is not sufficient and there is no Reliability Standard that requires Planning coordinators and Transmission Planners to develop an outage coordination procedure. IRO-017-1 R1 requires each Reliability Coordinator to develop, implement, and maintain an outage coordination process for generation and Transmission outages within its RC Area.

Texas RE previously submitted comments including proposed language to R1 that would require each Transmission Planner and Planning Coordinator to maintain System models that include known outages of generation or Transmission Facilities. Texas RE again recommends revising TPL-005 R1.1 as follows:

1.1 System models shall represent:

1.1.1. Existing Facilities;

1.1.2. Known outages(s) of generation or Transmission Facility(ies) scheduled in the Near-Term Transmission Planning Horizon selected according to an established procedure or technical rationale that, at a minimum:

1.1.2.1 Establishes a criteria, supported by a technical justification, for identifying significant known outages based on MW or facility ratings; and

1.1.2.2. Does not exclude known outage(s) solely based upon the outage duration.

The SDT appreciates your feedback. The SDT considers that the current approach allows the flexibility for the TPs and PCs to select those outages for consideration utilizing any and all inputs/criteria needed to perform the assessment. The SDT considers that the current approach meets the FERC directives and the SAR of this SDT. The SDT also notes that time was spent trying to derive criteria to help drive consistency, however given the differences in system topology and geographic areas there was not a one-size-fits-all approach available that would allow for all the registered entities to meet the FERC directive of including those outage that have impact for their regions.	
Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF	
Answer

Comment	
How does new 2.1.4 meet the SDT's belief stated in the Technical Rationale that there is an "implied need to strengthen the collaboration and consultation between the Reliability Coordinator and the planning entities at the outset of determining the known outages that should be assessed in the Near-Term Transmission Planning Horizon." What is the measurement of whether the Technical Rationale developed under 2.1.4 is acceptable – simply that is not based on duration of the outage? How does having a documented outage coordination procedure satisfy the need for performing TPL analysis? Most entities already have such a process that is totally unrelated to TPL analysis. While it may be implied, the documented outage coordination procedure does not explicitly state that any modeling or contingency analysis is required.

The SDT appreciates your feedback. The current draft as written is to analyze the near term planning horizon known outages. The SDT agrees that the addition is to help the coordination between IRO-017 and TPL-001. The SDT notes that changes to IRO-017 were considered as an alternate solution however changes to standards outside of TPL-001 were outside the scope of the SAR the team was provided. The SDT would also note that it considers removing the 6 month duration threshold for outages does not unnecessarily duplicate the assessment of known outages conducted as part of the operations horizon outage coordination process. The SDT considers that the current approach meets the FERC directives and the SAR of this SDT.

Response

The SDT appreciates your feedback. The SDT considers that the current approach allows the flexibility for the TPs and PCs to select those outages for consideration utilizing any and all inputs/criteria needed to perform the assessment. The SDT considers that the current approach meets the FERC directives and the SAR of this SDT. The SDT notes that if entities choose to run additional event types there is nothing in the current draft to preclude them from doing so. The SDT also notes that there is nothing in the current FERC directive that speaks to event types required to be run as part of this assessment. The current draft aligns with the previous version of TPL-001-4 Requirement R2, Part 2.1.3 for events to be considered for known planned outages.

Thomas Foltz - AEP - 5

Answer	No
Document Name	

Comment

As stated in our response to Question #1, AEP remains concerned by the increased complexity of Footnote 13 driven by its excessive detail. The version of Table 1 that is currently in effect is clear in its intent and application, however, we believe that Footnote 13 as currently proposed actually *removes* the clarity that was once there.

Likes 0	
Dislikes 0	

Response

The SDT appreciates your feedback. While the SDT recognizes that Footnote 13 has become more detailed as a result of the proposed revisions motivated by the SPCS/SAMS “Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request” report recommendations, the SDT does not believe it has become unnecessarily complex. On the contrary, the SDT considers that the proposed revisions to Footnote 13 has brought increased attention to assessment concerns that pre-existed in TPL-001-4 and has clarified considerations about non-redundant components of a Protection System, while facilitating flexibility in addressing the non-redundant components of a Protection System reliability concerns.

The SDT appreciates the suggestion to propose a new NERC Glossary of Terms definition, but believe this is unnecessary given the existing definitions of Normal Clearing and Delayed Fault Clearing. To the point, the SDT considers that the "intentional delay" included in the Delayed Fault Clearing definition is both intentional and inherent to the design of backup protection. The SDT has added additional narrative to the Technical Rationale to clarify this topic.

The SDT has suggested potential approaches to addressing the challenges of coordinating considerations regarding non-redundant components of a Protection System between planning and protection personnel in the Technical Rationale.

Thank you, again, for your comments.

Bridget Silvia - Sempra - San Diego Gas and Electric - 3

Comment

SDG&E agrees with all revisions to TPL-001-4 except those related to P5 planning events for non-redundant components of a Protection System identified in footnote 13.

Likes 0	
Dislikes 0	

Response

Pursuant to the response from FERC Order 754, NERC SAMS and SPCS conducted an assessment, confirmed the existence of a reliability risk associated with SPF in Protection Systems, and concluded that it was appropriate to recommend that TPL-001-4 be modified to address the SPF. The SDT modified Table 1, Footnote 13 to capture the SAMS/SPCS recommendations for Category P5 events.

Leonard Kula - Independent Electricity System Operator - 2

Answer	No
Document Name	

Comment

We maintain that the Contingency event that represents a 3 ph fault plus a failure of a non-redundant component of a Protection System remains a reliability concern and reiterate that the SDT's alternatives offered in Draft #1 and Draft #3 would address it:

- Keep the 3ph fault + SPF in Protection System event in Table 1 Stability Performance Extreme Events, but require a Corrective Action Plan when Cascading is identified.
- Move the 3 ph fault + SPF in Protection System event to Table 1 Steady State & Stability Performance Planning Events and create a new P8 category. The only System performance requirement that should apply to P8 is that Cascading shall not occur and a Corrective Action Plan should be required when Cascading is identified.

The existing evaluation (except to separate breaker failure from the SPF in Protection System event) brings us back to square one.

Likes 1	Hydro One Networks, Inc., 1, Farahbakhsh Payam
Dislikes 0	

Response

The SDT's previously proposed treatments of the 3ph Fault with SPF as (1) an extreme event requiring a CAP or as (2) a P8 planning event were not supported by industry. Hence, the SDT proposed in the Standard that, "3phase fault on…with failure of a non-redundant component of a Protection System resulting in Delayed Fault Clearing", replace and be treated in the same manner as, "3phase fault on…with…a relay failure resulting in Delayed Fault Clearing".

Devin Shines - PPL - Louisville Gas and Electric Co. - 1,3,5,6 - SERC,RF, Group Name PPL NERC Registered Affiliates

Answer	No
Document Name	

Comment

In the Extreme Events portion of Table 1, the use of the NERC defined term "Normal Clearing" is not sufficiently clear or could be misapplied. A composite protection system can be made up of redundant systems with significantly different clearing times. Failure within a redundant composite protection system can be interpreted as "Normal Clearing" based on the NERC definition of a "Misoperation". Using this definition, "Normal Clearing" would occur without providing clearing fast enough to meet stability

requirements. Steady State and Stability Performance Extreme Events should be evaluated by simulating "worst case clearing time" of the composite protection system for the element(s) unless otherwise specified. The use of the term "Delayed Fault Clearing" in the Stability Items 2e through 2f of the Extreme Events portion of Table 1 could be interpreted differently based on the NERC definition of "Delayed Fault Clearing". The NERC definition of "Delayed Fault Clearing" seems to apply to failures of an entire composite protection system, whereas clearing occurs via breaker failure or some remote clearing after an intentional delay. Using this interpretation of the definition, the failure of a portion of a redundant system which results in a slower clearing time would not meet the definition of "Delayed Fault Clearing", but could still result in clearing that does not meet stability requirements. Stability Items 2e through 2f of the Extreme Events portion of Table 1 should be studied under conditions where failure of a non-redundant component results in "worst case clearing time" for the composite protection system of the element(s).	
Likes 0	
Dislikes 0	
Response	
The SDT did not change the use of "Normal Clearing", as applied to Table 1 Extreme Events, but feels that the NERC definition is adequate. As applied in the proposed Standard, the use of "Delayed Fault Clearing" conveys the intent that the fault should be assessed recognizing the delay in fault clearing resulting from the possible SPF of the non-redundant components of a Protection System as enumerated in Table 1 Footnote 13. In this standard, Footnote 13 describes the components to be considered in SPF, which could cause a failure of a Protection System to operate as intended.

For the same reasons stated in question 2. BPA considers that removing Part 1.1.2 is appropriate. BPA does not feel that it is appropriate to incorporate it under R2. The system assessment process and the outage process are separate and distinguishable processes that should not be dependent on each other for purposes of compliance. BPA's preference would be for the planned outages process to be in a new standard entitled Long Range Outage Coordination Process. If this is not feasible, due to being outside the scope of the project, BPA would like to see two new requirements created for known outages planned for steady state analysis and known outages planned for stability analysis. It may make sense to create new subrequirements under R3 and R4 respectively, or have them be stand alone requirements. BPA is ok with the content of the requirement, just not the location of the requirement.

Likes 0

MISO supported the changes previously proposed by the SDT to create the P8 contingency. Given that a Corrective Action Plan is needed to address instability or cascading resulting from a three-phase fault and subsequent failure of a non-redundant protection system component, the best way to achieve this requirement is through the creation of a P8 contingency rather than extreme events. Therefore, MISO agrees with the proposed P8 event. MISO would also support expanding the P5 contingency definition to include both a phase-to-ground fault and a three-phase fault as well should the Standard Drafting Team prefer to expand the P5 contingency definition rather than establish a new P8 event. The aspects of the current TPL-001-4 and proposed TPL-001-5 standards that address the area of planned maintenance outages mischaracterize the role of transmission planning – which is to provide for an orderly transmission expansion program that ensures the transmission system is adequate, reliable, robust and resilient at all times in the future given the lead times associated with making	

necessary system improvements. Adequacy, reliability, robustness, and resilience include the flexibility of a transmission system to allow for the planned outage of any single transmission facility during non-peak periods in a manner that i) does not require the curtailment of firm load and ii) provides for the system to be operated in an N-1 secure state after the single transmission facility has been removed from service for planned maintenance or other purposes. All transmission facilities require planned outages from time-to-time to facilitate maintenance and repair work that cannot be performed hot, to facilitate capital upgrades to the transmission system or other facilities in the vicinity of the transmission facility, or for other purposes. Therefore, the eventual occurrence of a future planned outage on a transmission facility is certain and "known", not "hypothetical", only the timing and duration of the future outage could be considered uncertain or "hypothetical". If the transmission system is not planned in a manner that allows for any single facility to be removed for maintenance under non-peak conditions, then the system will not maintain the necessary adequacy, robustness and flexibility to accommodate maintenance requirements in general.

In FERC Order 786, the Commission indicated the following at PP 41:

"We agree with commenters such as MISO and ATCLLC that certain elements may be so critical that, when taken out of service for system maintenance or to facilitate a new capital project, a subsequent unplanned outage initiated by a single-event could result in the loss of non-consequential load or may have a detrimental impact to the bulk electric system reliability. A properly planned transmission system should ensure the known, planned removal of facilities (i.e., generation, transmission or protection system facilities) for maintenance purposes without the loss of non-consequential load or detrimental impacts to system reliability such as cascading, voltage instability or uncontrolled islanding." (emphasis added)

It is "known" that every transmission facility will eventually need to be taken out of service for planned maintenance or other purposes, thus the proper planning approach to planned maintenance outages should be to ensure that the transmission system is planned with sufficient robustness and resilience to accommodate the planned maintenance flexibility during off-peak periods that will be required regardless of whether or not such activity has been scheduled at the time the planning assessment is conducted.

While some have argued that outages can be fully managed by outage coordination efforts focused on the operating horizon, if the system is not planned and expanded to maintain sufficient adequacy and robustness to support future outages, the outage coordination functions may be backed into a corner where there is no choice but to shed load to accommodate a planned outage (which is generally considered unacceptable) or deny an outage given the inability of the outage coordination function to make the necessary system upgrades in the operating horizon that should have been made by the planning function within the planning horizon. An important function of planning is to support operations, which includes ensuring the system is adequate and robust enough to provide flexibility to the outage coordination function to schedules planned outages when they are needed without sacrificing reliability or load continuity.

A proposed remedy would be to expand the P3 and P6 contingency definitions to evaluate an additional multiple outage scenario with no load loss. This scenario would include a planned outage, system adjustments, and then a contingency, but no consequential or non-consequential load loss would be allowed for the planned outage element, and no non-consequential load loss would be allowed for the contingent element. This contingency definition, which would be applicable only for non-peak conditions where planned maintenance is normally performed, could be implemented as a P2.1 contingency, followed by system adjustments (but no load shed), followed by a P1 contingency. With this new contingency added, the system would be planned to accommodate the planned outage of any one system element (transmission or generation element) during off-peak periods while ensuring the system can continue to operate in a manner that is N-1 secure with no non-consequential load loss. Use of the P2.1 contingency as the maintenance contingency ensures continuity of service to load for the maintenance outage, which aligns with how the system would be operated. This change to the standard ensures that there is a minimal level of flexibility to provide for the planned outage of any single element in the system, which better aligns with the overall goal of transmission planning to ensure the system is adequate, robust, resilient, and reliable in the future.

The SDT's previously proposed treatment of the 3ph Fault with SPF as a planning event that required a Corrective Action Plan was not supported by industry. Hence, the SDT proposed in the Standard that, "3phase fault…with failure of a non-redundant component of a Protection System resulting in Delayed Fault Clearing", replace and be treated in the same manner as, "3phase fault on….with…a relay failure resulting in Delayed Fault Clearing". The standard does <u>not</u> require a Corrective Action Plan for the 3ph Fault with SPF or any other extreme event. The changes proposed in Requirment R2, Parts 2.1.4 and 2.4.4 are sufficient and broad enough to accomplish what is proposed in a manner that addresses the unique preferences of the commenter. The SDT does not agree with the broad assertions of the commenter, which do not seem to sufficiently or adequately recognize the diversity of how outages are and can be managed. The proposed alternatives are more complicated than necessary for industry-wide application, but may well provide a good basis for the commenter to develop their own suitable outage coordination procedures or Technical Rationale envisioned by this proposed standard.	
Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC	
Answer	No

Document Name	
Comment	
The standard should be revised to represent the true intent for this standard, which is to hold the PC and TP accountable for assessing the state of the transmission system under specific scenarios, determine deficiencies, and act to correct those deficiencies. Requirements outside of the control of the TP are not an effective tool to determine if the intent of those requirements has been met. The TP can only assume that transmission equipment outages that represent a future timeframe (year one or year two), have been submitted by the entity requesting the outage, and are correct.	
Likes 0	
Dislikes 0	
Response	
The comments actually support the appropriateness of the structure of the proposed Requirment R2, Parts 2.1.4 and 2.4.4, highlighting that outage coordination and planning practices vary greatly across the industry. Hence, the proposed Standard is structured to enable outage coordination procedures or Technical Rationale to be fashioned that result in the capture of only those known outages which it would be reasonable, meaningful, and appropriate for the TP/PC to study in the Near-Term Planning Assessment.

See proposed changes to Requirements 1 (Part 1.1.2) and 2 (Parts 2.1.4 and 2.4.4) above. Clarification in needed on 'Table-1 – Extreme Events Second Column Stability Item 2f'. This should be changed to 3-phase close-in fault on Transmission circuit with failure of a non-redundant component of a Protection System result in Delay Fault Clearing. The FERC Order 754 study only looked at close-in line and bus faults with remote clearing. For end of line 3-phase faults, fault detection is unlikely with a failure of a non-redundant battery due to in-feed effect. It is not possible to run a stability study with this indeterminate	

state. The requirement as written will require installation of redundant batteries or battery monitors at all BES substations. If this is the case corrective action plans may take years to complete. Given the low probability of a battery failure concurrent with a 3-phase end of line fault, was this the intent of the standard? Also, for end of line faults can credit be given for the chargers ability to trip?

Response

The SDT appreciates your feedback. The SDT considers that the current approach meets the FERC directives and the SAR of this SDT. The SDT notes that the FERC directive states that outages with a duration of less than 6 months could have a greater impact than those longer than 6 months. The SDT also notes that it considered a bright line of less than 6 months however the SDT ultimately decided that any duration chosen wouldn't be appropriate for every registered entity. The current draft provides the flexibility to determine which known outages have an impact and to study those in the near term planning horizon.

Dennis Chastain - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer	No

Comment

TVA believes that the proposed changes to Footnote 13d creates a significant cost impact for a very small probability event. TVA believes that the proposed changes to Requirement 2, Parts 2.1.4 and 2.4.4 would add no value and create siginificant new effort and time to duplicate operations studies.

Likes 0	
Dislikes 0	

Response

The types of single points of failure noted in Footnote 13d were factors in the actual events that raised the single point of failure concern and motivated the proposed SPF changes to the Standard.

The SDT agrees with the importance of not duplicating operations study and normal outage coordination processes. Hence, the proposed Standard is structured to enable outage coordination procedures or Technical Rationale to be fashioned that result in the capture of only those known outages which it would be reasonable, meaningful, and appropriate for the TP/PC to study in the Near-Term Planning Assessment.

.Please see comments in question 1 and 2 above. *Additional Comment for consideration, related to Requirement #4 (related to clarification of the Standard):* Requirement 4.1 states that "Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1….." Immediately after 4.1, sub-requirements 4.1.1 through 4.1.3 specify specific system/generator stability performance requirements which are not mentioned in Table 1. Our observation is that Table 1 includes steady state and stability related performance requirements. This apparent placement of performance requirements in more than one location within the Standard document is confusing. Recommendation for consideration is to move sub-requirements 4.1.1 through 4.1.3 to Table 1. *Additional Comment for consideration, related to clarification of the Standard:* Regarding Table 1, if the performance requirements (steady state / stability) are not being met, AND, if Table 1 indicates that non-consequential load loss and interruption of Firm Transmission Service are allowed, is a specific corrective action plan required as per Requirement 2.7 (assuming that non-consequential load loss and/or interruption of Firm Transmission Service would allow for meeting the performance requirements)? This question relates to a scenario where Footnote 12 does not apply. A general recommendation is to clarify within the standard whether or not a specific corrective action plan is required to be documented, as per Requirement 2.7, in the Planning Assessment for this scenario (i.e. performance requirements are not being met and Footnote 12 does not apply).

NV Energy feels it is prudent to require a corrective action plan resulting from a three-phase fault and subsequent failure of a non-redundant protection system component, and should therefore not be considered an extreme event, but rather a planning event. NV Energy did not agree with the changes previously proposed by the SDT to create a new P8 contingency, but would support expanding the P5 event to include a three phase fault or a L-G fault, or replacing the L-G fault type with a three phase fault.

Response	
The SDT's previously proposed treatment of the 3ph Fault with SPF as a planning event that required a Corrective Action Plan was not supported by industry. Hence, the SDT proposed in the Standard that, "3phase fault…with failure of a non-redundant component of a Protection System resulting in Delayed Fault Clearing", replace and be treated in the same manner as, "3phase fault on….with… a relay failure resulting in Delayed Fault Clearing".

Please see comments in question 2 above regarding known outages.

The current title of the technical rationale document is misleading as it could be interpreted as the technical rationale for single points of failure only, instead of TPL-001-5 as a whole. We request that the title of the technical rationale be changed to "TPL-001-5 Technical Rationale."

The language in 2.1.5 should be modified to align with 2.4.5 as shown below:

When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

Additionally, per the SDT's response to the last round of comments submitted, please add language in the technical rationale to clarify on what is meant by the spare equipment strategy. For reference, below were the comments submitted –

Does "spare equipment strategy" mean the existence of at least a single spare for major transmission equipment that has a lead time of more than one year; and does Requirement 2.4.5 imply that the existence of such a spare would eliminate the need to assess the impact of the possible unavailability of such equipment on System performance? If so, then Requirement 2.4.5 should be written this way.

As currently written, Requirement 2.4.5 lacks clarity. Every reasonable "spare equipment strategy" for equipment with a lead time of one year or more could result in the unavailability of such equipment; it is a matter of probability. For example, an Entity with 100 large power

transformers could have a spare transformer strategy of maintaining one system spare. However, it is possible that two transformers could fail during time span of one year. With only one spare, the Entity would be exposed to operating the system for up to one year with one less transformer than designed. Even if the Entity has four (4) spares, it is still possible that five (5) transformers could fail during one year (albeit with much lower probability), which would leave the Entity similarly exposed. Greater clarity is required for Requirement 2.4.5, as is more criterion development.

The Technical Rationale appropriately references "Project 2015-10 Single Points of Failure TPL-001". The SDT did not feel that additional changes to Requirment R2, Part 2.1.5 were warranted or consistent with the SAR. The Standard is not prescriptive regarding what constitutes a spare equipment strategy and supports the TP/PC using reasonable judgement to determine the sufficiency of their sparing strategy.

The SDT appreciates your feedback. Q1: The SDT appreciates your feedback. The SDT did struggle with the topic of giving similar monitoring and reporting exceptions to auxiliary and lockout relays. While relay monitoring (e.g., relay trouble indication) may be adequate to announce when a lockout or auxiliary relay may have failed, it is not clear that relay monitoring is sufficient for identifying all possible relay modes of failure that may lead to Delayed Fault Clearing. Additionally, the SPCS/SAMS "Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" report specifically included auxiliary relays and lockout relays as DC control circuitry protection system attribute, noting that these devices are generally unmonitored and may remain in a failed state undetected for an extended period. Further, auxiliary and lockout relay failures in certain Protection System designs can be much more detrimental, leading to significantly Delayed Fault Clearing, than expected for the failure of a trip coil. For these reasons, the SDT chose not to exclude monitored and reported auxiliary relays and lockout relays when considering the control circuitry as a non-redundant component of a Protection System. Thank you, again, for your comments.	
Douglas Johnson - American Transmission Company, LLC - 1	
Answer	No

Comment	
The addition of new single point of failure of selected non-redundant Protection System Components to the P5 contingency event category seems appropriate. Elimination of the P8 contingency event category and moving the new single point of failure of selected non-redundant Protection System Components to the Extreme Events category seems appropriate. The language in Footnote 13 is still a concern, as noted in ATC's comments on Question 1 above.

Response

Q1 Response: The SDT appreciates your feedback. The SDT intent has been described extensively in the Technical Rationale. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT has added treatment of the comparable Normal Clearing times principle to the Technical Rationale.

The SDT considers that the proposed Footnote 13b offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System for simulation as the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. The SDT agrees with the respondent that a single communications system associated with protective functions necessary for correct operation of a communication-aided protection scheme required for Normal Clearing that is not monitored and reported at a Control Center should not be considered redundant.

The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5, does not believe that somehow Footnote 13 transfers identification of reliability risks associated with non-redundant components of a Protection System to any other Reliability Standard.

The SDT considers that Footnote 13 is consistent with the SPCS/SAMS “Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request” report recommendations.

The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear.

Thank you, again, for your comments.

ITC thanks the SDT for their work on developing this revision to the TPL-001 and agrees with the work they have done so far. ITC does not believe though that the language for the Requirements 3.5 and 4.5 for the evaluation of the non-redundant component of a protection scheme goes far enough. While it does require industry to evaluate the consequences of the configurations, it does not require a Corrective Action Plan be developed for any significant affect to the transmission system. ITC believes a CAP should be required.

The SDT appreciates your feedback. The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear.

The SDT intent has been described extensively in the Technical Rational. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT asserts that consideration of non-redundant components of a Protection System is necessary to properly simulate the Table 1 Planning Event P5 for the purpose of assessing whether required System performance is achieved. If, after proper consideration and simulation, required System performance is achieved, then there may be no impetus to make non-redundant components of a Protection System redundant. On the other hand, after proper consideration and simulation it is demonstrated that required System performance is not achieved, making non-redundant components of a Protection System redundant may be but one of many alternatives for corrective actions to obtain required System performance.

The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5.

Comment	
The first timeframe following FERC's approval of TPL-001-5 needs to be 5 years, rather than 3 years, to perform all the required tasks (e.g., make model changes; develop the new Footnote 13 contingencies; perform the new known outage, long lead time, P5, and Extreme event analyses; and develop CAPs for non-P5 contingency system deficiencies). The timeframes of 2 years and 4 years to complete the other required tasks seem acceptable.	
Likes 0	
Dislikes 0	
Response	
Thank you very much for your comments. SDT appreciates it. However, SDT considers that 3 years is adequate time for the first assessment to be completed without CAPS. There is an additional 2 years allowed to developed CAPS which provides a total of 5 years for assessment and CAPS together.	
Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - MRO, Group Name SPP Standards Review Group	
Answer	No
Document Name	
Comment	
The SSRG notes that after the 48-month implementation sunset provision has expired, the implementation plan will not provide an entity with sufficient time to implement a Corrective Action Plan (CAP) identified in future annual planning cycles.	

For example, a CAP that identifies a facility that will require longer than one year to construct will not be in-service by the next annual planning cycle, which will impact the Planning Coordinator's (PC) the ability to meet the Table 1 performance requirements for the next annual planning assessment. In other words, an unintended and unavoidable consequence of the requirement may be a violation of R2.7 through no fault of the PC performing the annual study and preparing the CAP.

A solution to the issue would be to include an exception in Section 2.7.3 or create a new Section 7.2.4 that alleviates the need to meet the Table 1 performance metrics for subsequent planning assessments when P5 events identify a capital project as a CAP and no other mitigation can be achieved. The exception would be extended until the capital project can be placed into operation.

Response

Thank you very much for your comments. SDT appreciates it. The SDT did consider employing an open-ended approach to when entities must comply with the portion of Requirement R2, Part 2.7 that states: "the planned System shall continue to meet the performance requirements in Table 1" for CAPs developed to address failures to meet System performance requirements of the Table 1 Planning Event P5. However, the SDT determined that having an indefinite period before fully enforcing the proposed TPL-001-5 was unacceptable. The SDT has proposed an implementation plan that is of significant duration which is intended to give applicable entities sufficient time to modify appropriate processes as necessary to prepare for analytical changes affected by the modifications to the Table 1 Planning Event P5 and Footnote 13. Additionally, the SDT recognizes that unforeseen circumstances may inevitably affect an entity's ability to achieve the actions or timetable specified in a Corrective Action Plan, but this is a reality present in the existing TPL Reliability Standard and is not fundamentally different with regards to the proposed TPL-001-5. Therefore, the SDT decided not to make any changes to the implementation plan.

Glenn Barry - Los Angeles Department of Water and Power - 5

• PJM planning procedures do not allow for redispatch to address reliability criteria violations. Based on this, PJM has some concerns regarding requirements to fully implement Corrective Action Plans in accordance with the identified schedule. As the RTO, PJM does not have control over the construction schedule, and relies on individual Transmission Owner to complete construction and implement enhancements by the required in service date detailed in the Corrective Action Plan. • The sentence "The first annual Planning Assessment shall be completed in accordance with TPL-001-5, but without CAPSs for revised P5, by this date." in Figure 1 of the Implementation Plan could use some clarification. PJM in concerned that the sentence implies that revised P5 events, while not requiring a CAP, still need to be included in the Planning Assessment at the t+36 Point on the timeline. PJM Proposes the following revisions to clarify that revised P5 events are not required for inclusion in the assessment during this first 36 month period: “The first annual Planning Assessment (excluding revised p5 events), shall be completed in accordance with TPL-001-5, but without CAPs for revised p5, by this date.”

Duke Energy does not support the proposed Implementation Plan. Without knowing at this time the potential size and scope of the work that will be necessary for implementing the CAPs, we cannot agree on the 48 month portion of the Implementation Plan. These corrective actions will likely involve improvements to protection systems for BES elements and these require system outages to critical lines that are only made available during low-load periods that will extend the overall time required to complete the CAP. We disagree with assigning an implementation period to an unknown scope of work. We suggest the SDT consider a flexible Implementation Plan with phases that can be assessed depending on the size and scope of work.

Comment

It would be better for the first timeframe to be 4 or 5 years, rather than 3 years, from FERC approval of TPL-001-5 to make the model changes, develop the new contingency files, perform the additional analysis, and developing CAPs for non-P5 contingency system deficiencies. The second timeframe of 2 years and third timeframe of 4 years to complete the other required tasks seem acceptable.

While the implementation timelines to study and develop CAPs are reasonable, TVA does not agree with the implementation timeline for completing CAPs to address the modified P5 events. These changes will require extensive work in order to make protection systems completely redundant for these events, requiring switch houses in some cases. If several switch houses are required, the proposed implementation plan would not provide adequate time to coordinate extensive outages and complete the corrective action plans.

As we have mentioned before, SDG&E does not agree with the changes related to P5 planning events for non-redundant components of a Protection System identified in footnote 13. Unfortunately, a great deal of the changes to the implementation plan are to allow time for the Transmission Planners to coordinate with protection engineers on addressing these new requirements.

Texas RE appreciates the SDT's attempt to clarify the implementation plan and the timeline provided is helpful. Texas RE recommends explicitly saying which requirements are applicable in the Compliance Date and Initial Performance date sections. Based on the words written (not on the visual timeline), Texas RE understands the IP as follows:

- First calendar quarter 36 months following regulatory approval.
    - The effective date of the standard is the first day of the first calendar quarter 36 months following the effective date of the applicable governmental authorities order approving the standard. This date serves as a starting point for the implementation plan.
    - In accordance with the Initial Performance section, applicable entities must complete the planning assessment without CAPs by the effective date of the standard, or 36 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes there is no requirement mentioned. **In the interest of clarity and not being vague Texas RE strongly recommends the implementation plan specify which requirement this date refers to.**
    - 60 months following regulatory approval.
        - In accordance with the Initial Performance section, applicable entities must develop any required CAPs under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13, items b, c, and d, or 36 months plus 24 months, or 60 months following the effective date of the applicable governmental authority's order approving the standard. Texas RE notes this is also indicated in the Compliance Date section, **which is redundant and could cause confusion**.
    - 108 months following regulatory approval
        - In accordance with the Compliance Date section, for CAPs developed to address failures to meet Table 1 performance requirements for the p5 planning event for the non-redundant components of a Protection System

	identified in footnote 13 items a, b, c, and d, or 36 plus 72, or 108 months following the effective date of the applicable governmental authority's order approving the standard.

The SDT appreciates your feedback. The SDT has created an implementation plan that is clear regarding the effective date of the proposed TPL-001-5 as well as the compliance dates of each of the modified requirements. Because the standard involves the performance of periodic requirements the implementation plan includes the dates by which entities must perform those requirements for the first time. The implementation plan was crafted in conjunction with NERC staff and according to NERC guidelines intended to standardize implementation across all future Reliability Standards.

5. ***Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost effective way of meeting the FERC directives in Order No. 754 and Order No. 786?***

Sandra Shaffer - Berkshire Hathaway - PacifiCorp - 6	
Answer	No
Document Name	
Comment	

PacifiCorp believes that the proposed revisions to TPL-001-4 to model known outages with a duration of less than six months in the annual Planning Assessment are not a cost effective way of meeting FERC directives in Order No. 786 as these studies are already being performed in TOP-003 and IRO-017 Operational Planning Assessments.

PacifiCorp agrees that the proposed revisions to TPL-001-4 along with the Implementation Plan are a cost effective way of meeting FERC directives in Order No. 754 addressing reliability issues associated with single points of failure in protection systems.

Response

The SDT appreciates your feedback. The current draft as written is to analyze the near term planning horizon known outages. The SDT agrees that the addition is to help the coordination between IRO-017 and TPL-001. The SDT notes that changes to IRO-017 were considered as an alternate solution however changes to standards outside of TPL-001 were outside the scope of the SAR the team was provided. The SDT would also note that it considers removing the 6 month duration threshold for outages does not unnecessarily duplicate the assessment of known outages conducted as part of the operations horizon outage coordination process. The SDT considers that the current approach meets the FERC directives and the SAR of this SDT.

BPA believes that the revision to the standard and the implementation plan do not adequately address industry concerns about the costs needed to plan and construct a project for a planned maintenance outage of short duration. Those planned maintenance outages will be coordinated ahead of time according to outage planning processes. It is not cost effective to plan and construct a project for a planned maintenance outage of short duration when planned outages of the same facility are not expected again in the foreseeable outage planning timeframes. Requiring a low-probability, single-point-of-failure of protection systems to be analyzed as a Planning Event is beyond prudent planning. The proposed changes could be a very-significant burden on Planning and Engineering staffs to investigate and identify “non-redundant” components of a Protection System.	

The proposed changes to the standard would require industry to protect against rare three-phase faults coupled with protection system failure. This should remain as an extreme event and allow the TP or PC to decide whether mitigating possible Cascading is cost effective. The cost effectiveness document falls short of providing any substantive cost effectiveness analysis and is more like a repeat of the proposed changes to the requirements & footnote 13.

Response	
The SDT appreciates your feedback. The SDT has proposed the current language in Requirment R2, Part 2.1.4 to address the concerns raised in FERC Order 786 that specifically states that a 6 month threshold could exclude maintenance outages of significant threshold. The SDT have included language that allows for the greater flexibility both in selecting outages and in modeling across the continent while meeting the FERC directive 786 based on industry comments. FERC Order 754 requires the consideration of P5 events based Section 1600 Data Request. A delineation has been created between P5 events and three phase faults which are considered an extreme event. The goal of the SDT was to ensure that cost effectiveness was considered and that different options were talked over. The SDT discussed at length different options and scenarios, and that the proposed draft and implementation plan meets the FERC directives and the SAR of this SDT.	
Terry BIlke - Midcontinent ISO, Inc. - 2

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC	
Answer	No
Document Name	
Comment	
FERC directives, cost effective or not, are a direct order of action which in accordance with the directive, if the directives determine that transmission system deficiencies exist being detrimental to state of the transmission system, those deficiencies should be acted on and corrected. Allowing more time (+12 months to all milestones) for the implementation as a result of these changes, may minimize the financial impact.

Comment	
TVA does not believe the proposed changes to Footnote 13d are a cost effective approach. Redundancy of DC control circuitry will result in significant station upgrades or, in many instances, require the construction of new switch houses. TVA believes there is not an economic justification of Footnote 13d based on the historical failure rate of DC control circuitry.	
Likes 0	
Dislikes 0	

Response	
The SDT appreciates your feedback. The SDT considers that Footnote 13d is consistent with the SPCS/SAMS “Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request” report recommendations. The SDT considers that the probability of failure for a non-redundant component of a Protection System should not be confused with the severity of failure to meet System performance requirements of Table 1. The SDT has emphasized in the Technical Rationale that Footnote 13 directs which non-redundant components of a Protection System should be considered when simulating the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Footnote 13 does not prescribe a level of redundancy for the System, nor does it prescribe Corrective Action Plans for non-redundancy. To the point: the Table 1 Planning Event P5 prescribes the required System performance given failure of a non-redundant components of a Protection System. The SDT considers that the proposed Footnote 13d offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System for simulation as the Table 1 Planning Event P5.	
Robert Ganley - Long Island Power Authority - 1	
Answer	No
Document Name	
Comment	
While the proposed revisions to TPL-001-4 along with the Implementation Plan may be a cost effective way of meeting the FERC directives in Order No. 786 and Order No. 754 in terms of corrective action plans, the proposed revisions will present a very significant burden on Planning and Engineering staffs to investigate and identify “non-redundant” components of a Protection System. This incremental burden will have adverse cost impacts.

Comment	

See comments in Question 1 regarding the acceptability of backup protection or Composite Protection System if they provide acceptable System performance. It is not cost effective to require the costlier installation of fully identical redundant primary protection when the primary protection happens to be faster and trip fewer Elements than acceptable backup protection or a Composite Protection System.

It is unclear what evidence would be sufficient to demonstrate compliance with Footnote 13. An onerousFor example, the assembly of sufficient evidence of redundant control circuitry for an audit may involve the compilation of hundreds of station schematic drawings, wiring drawings, and photos, beside description documents that may be needed to explain the substation evidence. Sufficient evidence to demonstrate redundant communications and DC supplies may be similarly burdensome.

Likes 0	
Dislikes 0	

Response

The SDT appreciates your feedback. The SDT intent has been described extensively in the Technical Rationale. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT asserts that consideration of non-redundant components of a Protection System is necessary to properly simulate the Table 1 Planning Event P5 for the purpose of assessing whether required System performance is achieved. If, after proper consideration and simulation, required System performance is achieved, then there may be no impetus to make non-redundant components of a Protection System redundant. On the other hand, after proper consideration and simulation it is demonstrated that required System performance is not achieved, making non-redundant components of a Protection System redundant may be but one of many alternatives for corrective actions to obtain required System performance.

The SDT has revised Footnote 13 to be explicit about what non-redundant components of a Protection System shall be considered; the SDT disagrees that it is necessary to specify equipment that need not be considered in Footnote 13. The equipment omitted from Footnote 13 consideration is described in the Technical Rationale. Additionally, revisions to the Technical Rationale to address items such as reclosing circuitry and trip coils have been affected.

The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5.

Comment	
The proposed addition of "non-redundant" components of a Protection System, in particular Footnotes 13.b. and 13.d., to this Standard may add significant resource and financial burden to Transmission Owners (TOs) that in all cases may not provide a benefit to BES reliability. Although a planning standard, the Requirements as proposed may indirectly result in TOs expanding internal "design" standards to implement redundant Protection Systems on all transmission facilities regardless of the impact on BES reliability. As an alternative approach, the SDT could consider addressing the FERC directives by expecting planning assessments be performed with the assumption that all Protection Systems are non-redundant, and then when concerns are identified, the entity would confirm that there is a redundant Protection System in place or develop a CAP to address the non-redundant Protection System. Other than increasing the scope of the planning assessments, this type of process to investigate concerns as they are identified, might eliminate the initial administrative burden on collecting detailed Protection System information and building models with sufficient detail and accuracy. It would also avoid the unintended consequence of TOs upgrading all transmission facilities with non-redundant Protection Systems, regardless of the impact on BES reliability.

ATC has concerns about that current Implementation Plan and cost-effectiveness of the proposed revisions to TPL-001-4. The current proposed language for Footnote 13 leaves uncertainty in applicability and potential gaps in studies through the use of exemptions, as noted in ATC’s comments on Question 1 above. Furthermore, the uncertainty in the amount evidence to prove redundancy and/or monitoring has the potential to be a significant work effort. Regarding studies that are to be performed, the proposed TPL-001-5 standard and Implementation Plan are cost-effective, with the exception being the first 3-year timeframe of the Implementation Plan, as noted in ATC’s comments on Question 4 above.

The SDT appreciates your feedback. The SDT intent has been described extensively in the Technical Rationale. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT has added treatment of the comparable Normal Clearing times principle to the Technical Rationale. The SDT considers that the proposed Footnote 13b offers applicable entities sufficient flexibility when considering non-redundant components of a Protection System for simulation as the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h.	

The SDT agrees with the respondent that a single communications system associated with protective functions necessary for correct operation of a communication-aided protection scheme required for Normal Clearing that is not monitored and reported at a Control Center should not be considered redundant.

The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5, does not believe that somehow Footnote 13 transfers identification of reliability risks associated with non-redundant components of a Protection System to any other Reliability Standard.

The SDT considers that Footnote 13 is consistent with the SPCS/SAMS "Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request" report recommendations.

The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear.

Comment	

The proposed revision and 9-year implementation plan may be a reasonable way of meeting the FERC directive. However, MH feels that the analysis and mitigation of 115 kV and 138 kV stations is burdensome and likely expensive without necessarily improving overall BES reliability. As a result, we propose the following:

1. Implementing a risk based assessment to identify critical facilities of concern rather than making full protection redundancy a bright line requirement for all BES facilities.
2. For P5 definition of HV limit should be considered from 200 to 299kV.

GENERAL COMMENT

MH will be unable to adopt this standard as a NERC standard based on legislative restrictions in Manitoba. However, changes proposed in TPL-001-5 that are acceptable to MH would be adopted in a future Manitoba standard, MH-TPL-001-5.

Q1 Response: The SDT appreciates your feedback. The SDT agrees with the awkwardness of the Footnote 13 subpart language and has revised it to be more clear.

The SDT intent has been described extensively in the Technical Rationale. In summary, the SDT disagrees that backup protection is redundant to a Protection System designed for Normal Clearing. Moreover, by NERC Glossary of Terms definition, Delayed Fault Clearing is that which is associated with correct operation of a breaker failure protection system or backup protection. The SDT has emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The SDT asserts that consideration of non-redundant components of a Protection System is necessary to properly simulate the Table 1 Planning Event P5 for the purpose of assessing whether required System performance is achieved. If, after proper consideration and simulation, required System performance is achieved, then there may be no impetus to make non-redundant components of a Protection System redundant. On the other hand, after proper consideration and simulation it is demonstrated that required System performance is not achieved, making non-redundant components of a Protection System redundant may be but one of many alternatives for corrective actions to obtain required System performance.

The SDT disagrees that the single communication system exemption when a system is monitored and reported to a Control Center somehow exposes operating entities, such as a Transmission Operator, to any compliance risk. The SDT has emphasized that the

consideration of non-redundant components of a Protection System, including acceptable exclusions, simply affect the manner by which Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h are simulated. The SDT does not know of any other Reliability Standard that references Footnote 13 other than TPL-001-5. Thank you, again, for your comments.

OKGE supports the language contained in Footnote 13 that allows monitoring of an element rather than requiring redundancy because it mitigates the financial burden placed on the TO and GO to maintain true redundancy elements to protect their system.

We believe that meeting FERC Order 786 has nothing to do with cost effectiveness. While we agree with the concept of requiring redundant system protection elements only where they are needed, per Order 754, the process of having system protection engineers	

perform analysis for each BES facility to determine clearing times for failures of non-redundant system protection elements is burdensome and will require significant additional man-hours.

Additional comments received from Mike Smith - Manitoba Hydro (via attachment link in the comment report)

MH recommends the following changes to the footnote 13 of Table 1 (new text in red, removed text in green strikeout).

b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (except a single communications system that is both monitored and reported at a Control Center shall ~~not~~ be considered ~~non-~~redundant);

c. A single station dc supply and it's DC distribution circuits associated with protective functions required for Normal Clearing (except a single station dc supply and it's DC distribution circuits that is both monitored and reported at a Control Center for both low voltage and open circuit shall ~~not~~ be considered ~~non-~~redundant);

d. A single ~~control~~ trip circuitry ~~(including auxiliary relays and lockout relays)~~ associated with protective functions, from the ~~dc supply~~ protection relay through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (except a single trip circuit and coil that is both monitored and reported at a Control Center shall ~~not~~ be considered ~~non-~~redundant).

e. A single auxiliary tripping or lockout relay associated with protection tripping;

Rationale:

In footnote-13c, it is not clear whether or not monitoring is a satisfactory way to address only the SPF of the main supply (batteries and main bus) or also of the various branch circuits involved in DC distribution. The proposed changes allow for monitoring exceptions for DC Distribution and components of the trip circuit which are low probability items for failure similar to the previous exceptions permitted for DC supplies, communications and trip coils. We would also like to propose to put auxiliary trip relays and lockout relays on their own line to make it 100% clear that they must be considered in a SPF analysis.

Comments received from Jeremy Voll - Basin Electric Power Cooperative (via attachment link in the comment report)

Questions

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

☐ Yes
☒ No

Comments: Please consider the following:

Remove the double negative wording in 13.b, 13.c, and 13.d to make it clearer and less complicated with wording like, "shall be considered redundant".

Add wording like, "Backup protection or a Composite Protection System is an acceptable alternative to a fully identical redundant protection if it provides acceptable System performance." at the end of Footnote 13. A statement like this needs to be in the standard. Otherwise, it can be disregarded in an audit. In addition, replace the "Clarification: Is backup clearing redundant?" section on page 3 of the Technical Rationale with a different question and discussion like the following:

Clarification: "When is backup protection or a Composite Protection System acceptable as an alternative to fully identical redundant protection?"

If backup protection or a Composite Protection System (defined in PRC-004) provides acceptable System performance when a component of the primary Protection System fails, then fully identical redundant protection is unnecessary. Backup protection or a Composite Protection System may result in delayed clearing in comparison to a primary Protection System and trip additional Elements (refer to the NERC definition of Delayed Clearing and Normal Clearing Times). However, if any of these protection alternatives result is acceptable System performance, then fully identical redundant protection is unnecessary. If one of these protection alternatives already exist, then no Corrective Action Plan is needed. Or if one ofthese protection alternatives is effective, then it could be used as a suitable Corrective Action Plan in lieu of a fully identical redundant Protection System.

The terms and application of the terms in Footnote 13 do not appear to be consistent with those used in PRC-004 standard and the definition of Delayed Clearing and Normal Clearing Times in the NERC Glossy of Terms. The wording in the standard and the Technical Rationale should include and discuss the terms, Delayed Clearing and Normal Clearing Times and Composite Protection System and be consistent with them.

Add other statements at the end of Footnote 13 to clarify and confirm key matters in the TPL-001 standard so that it cannot be disregarded in an audit. The proposed wording for these statements are the following:

- "Voltage and current sensing devices of a Protection System are not considered." Discussion of this matter is only in the Technical Rationale (p. 4) right now.
- "Protective relays (such as sudden pressure relays or thermal temperature relays) that do not respond to electrical quantities shall not be considered redundant". Discussion of this matter is only in the Technical Rationale (p. 5) right now
- "The reclosing relays of a Protection System are not considered." This matter is not presently discussed in the Technical Rationale.
- "Two communication systems must use separate communication paths (e.g. not be the same power line carrier line, same OPGW, same microwave tower, or same tone path, etc.) to be considered redundant. A SONET ring shall be considered redundant." This matter is not presently discussed in the Technical Rationale.
- "Control circuitry includes everything from the DC supply through and including the trip coils, as well as auxiliary and lockout relays. A trip coils with monitoring do not need to be redundant." This matter is not presently discussed in the Technical Rationale.

Remove the single communication system exemption when a system is monitored and reported to a Control Center. This exemption exposes Transmission Operators (TOPs) to potential noncompliance with TOP-001 (and TOP-002 if the communication failure condition continues into the next operating day). In the real time environment, TOPs must respond to the loss of communication until that pathway is repaired. Under the definition of Real Time Assessment, which is used in TOP-001, TOPs must operate within all SOLs for the topology that exists at that moment, which explicitly includes the status of protection systems. With the loss of protective function communication, the delayed clearing due to a SLG fault could cause an unacceptable system stability performance deficiency. TOPs do not have real-time stability analysis tools to keep checking pre-contingency for potential unacceptable system stability and appropriate new/temporary SOLs. Removal of the exemption would result in planning horizon analysis of non-redundant communication failures and corrective actions when unacceptable stability performance is found. Therefore, removal of the exemption would reduce the risk of TOPs being noncompliant with TOP-001 and TOP-002.

2. Do you agree with the removal of Requirement 1, Part 1.1.2 and changes to TPL-001-4 Requirement 2, Parts 2.1.4 and 2.4.4, in order to meet the FERC directive in Order No. 786?

☒ Yes
☐ No

Comments:

The revisions appear to address both the FERC and industry issues and concerns. Do you agree with the proposed revisions to TPL-001-4?

☒ Yes
☐ No

Comments:

3. Do you agree with the proposed implementation plan?

☐ Yes
☒ No

Comments:

It would be better for the first timeframe to be 4 or 5 years, rather than 3 years, from FERC approval of TPL-001-5 to make the model changes, develop the new contingency files, perform the additional analysis, and developing CAPs for non-P5 contingency system deficiencies. The second timeframe of 2 years and third timeframe of 4 years to complete the other required tasks seem acceptable.

4. Are the proposed revisions to TPL-001-4 along with the Implementation Plan a cost-effective way of meeting the FERC directives in Order No. 754 and Order No. 786?

☐ Yes
☒ No

Comments:

See comments in Question 1 regarding the acceptability of backup protection or Composite Protection System if they provide acceptable System performance. It is not cost effective to require the costlier installation of fully identical redundant primary protection when the primary protection happens to be faster and trip fewer Elements than acceptable backup protection or a Composite Protection System.

It is unclear what evidence would be sufficient to demonstrate compliance with Footnote 13. An onerousFor example, the assembly of sufficient evidence of redundant control circuitry for an audit may involve the compilation of hundreds of station schematic drawings, wiring drawings, and photos, beside description documents that may be needed to explain the substation evidence. Sufficient evidence to demonstrate redundant communications and DC supplies may be similarly burdensome.

Comments received from Chris Scanlon – Exelon (via attachment link in the comment report)

1. With many clarifications added to the Technical Rationale concerning details of what is meant by Footnote 13, do you agree with the contents of Footnote 13?

☐ Yes
☒ No

Comments: For clarity of purpose the double-negatives should be removed from 13b, 13c, and 13d. Consider: "…*that is both monitored and reported at a Control Center shall ~~not~~ be considered ~~non-~~redundant)*"

End of report

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fourth draft of the proposed standard.

Completed Actions	Date
Standards Committee authorized Standard Authorization Request (SAR) for posting	October 29, 2015
SAR posted for comment	May 26 – June 24, 2016
Informal comment period	April 25 – May 24, 2017
45-day formal comment period with initial ballot	September 8 – October 23, 2017
45-day formal comment period with additional ballot	February 23 – April 23, 2018
45-day formal comment period with additional ballot	July 30 – September 14, 2018

Anticipated Actions	Date
10-day final ballot	October 2018
Board adoption	November 2018

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**
2. **Number:** **TPL-001-5**
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**

   4.1. Functional Entity

   - Planning Coordinator.
   - Transmission Planner.
5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

1.1.2. New planned Facilities and changes to existing Facilities.

1.1.3. Real and reactive Load forecasts.

1.1.4. Known commitments for Firm Transmission Service and Interchange.

1.1.5. Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within its respective area, using data consistent with MOD-032, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short

circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments, but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an

evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

3.3. Contingency analyses for Requirement R3, Parts 3.1 and 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power

system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for

performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information

None.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to “0.1”	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees.	

Version	Date	Action	Change Tracking
		TPL-001-3 was created after the Board of Trustees approved the revised footnote 'b' in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability: a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only:** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault[8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No

		4. Internal Breaker Fault (Bus-tie Breaker)[8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker[10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer[5] 3. Shunt Device[6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events	
Steady State & Stability For all extreme events evaluated: a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency. b. Simulate Normal Clearing unless otherwise specified.	
Steady State 1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments. 2. Local area events affecting the Transmission System such as: a. Loss of a tower line with three or more circuits.[11] b. Loss of all Transmission lines on a common Right-of-Way[11]. c. Loss of a switching station or substation (loss of one voltage level plus transformers). d. Loss of all generating units at a generating station. e. Loss of a large Load or major Load center. 3. Wide area events affecting the Transmission System based on System topology such as: a. Loss of two generating stations resulting from conditions such as: i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.	**Stability** 1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments. 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker[10] resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker[10] resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker[10] resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker[10] resulting in Delayed Fault Clearing. e. 3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. f. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	g. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. h. 3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. i. 3Ø internal breaker fault. j. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. 11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less. 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction. 13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows: a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (an exception is a single communications system that is both monitored and reported at a Control Center); c. A single station dc supply associated with protective functions required for Normal Clearing (an exception is a single station dc supply that is both monitored and reported at a Control Center for both low voltage and open circuit); d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices, required for Normal Clearing (the trip coil may be excluded if it is both monitored and reported at a Control Center).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. .The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level

   b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency

2. Amount of Non-Consequential Load Loss with:

   a. The estimated number and type of customers affected

   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community

3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance

4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance

5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12

6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12

7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12

8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV

   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or

   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)

2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fourth draft of the proposed standard.

Completed Actions	Date
Standards Committee authorized Standard Authorization Request (SAR) for posting	October 29, 2015
SAR posted for comment	May 26 – June 24, 2016
Informal comment period	April 25 – May 24, 2017
45-day formal comment period with initial ballot	September 8 – October 23, 2017
45-day formal comment period with additional ballot	February 23 – April 23, 2018
45-day formal comment period with additional ballot	July 30 – September 14, 2018

Anticipated Actions	Date
10-day final ballot	October 2018
Board adoption	November 2018

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**
2. **Number:** **TPL-001-~~4~~5**
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**

   4.1. Functional Entity

   - Planning Coordinator.
   - Transmission Planner.

5. **Effective Date:** **See Implementation Plan.**~~Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

   ~~Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where regulatory approval is not required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

   ~~For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-4, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-4:~~

   - ~~P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
   - ~~P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
   - ~~P2-1~~
   - ~~P2-2 (above 300 kV)~~

- ~~P2-3 (above 300 kV)~~
- ~~P3-1 through P3-5~~
- ~~P4-1 through P4-5 (above 300 kV)~~
- ~~P5 (above 300 kV)~~

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-~~010 and MOD-012 standards~~032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

~~**1.1.2.** Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.~~

~~**1.1.3.**~~**1.1.2.** New planned Facilities and changes to existing Facilities.

~~**1.1.4.**~~**1.1.3.** Real and reactive Load forecasts.

~~**1.1.5.**~~**1.1.4.** Known commitments for Firm Transmission Service and Interchange.

~~**1.1.6.**~~**1.1.5.** Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within ~~their~~ its respective area, using data consistent with MOD-~~010 and MOD-012~~032, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in

Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

~~**2.1.3.** P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.~~

~~**2.1.4.**~~**2.1.3.** For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner’s portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be ~~studied~~assessed. Based upon this assessment, an~~The studies~~ analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments, but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or ~~Special Protection Systems~~Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the

Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

3.3. Contingency analyses for Requirement R3, Parts 3.1 ~~&~~and 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. ~~If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.~~

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer

simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a ~~Special Protection System~~ Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event (s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. ~~If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.~~

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and -Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information

None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.~~6~~5.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.~~6~~5.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.~~6~~5.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.~~6~~5. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-~~010 and MOD-012~~032 standard~~s~~ and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				The responsible entity does not have a completed annual Planning Assessment.
R3.	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4.	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P7) in Table 1. OR

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
		for one of the categories (P1 through P7) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R4, Part 4.2 to assess the impact of extreme events.	for two of the categories (P1 through P7) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R4, Part 4.3.	The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R5.	N/A	N/A	N/A	The responsible entity does not have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, or the transient voltage response for its System.
R6.	N/A	N/A	N/A	The responsible entity failed to define and document the criteria or methodology for System instability used within its analysis as described in Requirement R6.
R7.	N/A	N/A	N/A	The Planning Coordinator, in conjunction with each of its Transmission Planners, failed to determine and identify individual or joint responsibilities for performing required studies.

R #	Violation Severity Levels

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to “0.1”	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees.	

Version	Date	Action	Change Tracking
		TPL-001-3 was created after the Board of Trustees approved the revised footnote ‘b’ in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability: a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only:** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault[8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker)[8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker[10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus ~~relay~~non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant ~~relay[13]~~component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer[5] 3. Shunt Device[6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
   a. Loss of a tower line with three or more circuits.[11]
   b. Loss of all Transmission lines on a common Right-of-Way[11].
   c. Loss of a switching station or substation (loss of one voltage level plus transformers).
   d. Loss of all generating units at a generating station.
   e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
   a. Loss of two generating stations resulting from conditions such as:
      i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
   a. 3Ø fault on generator with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   b. 3Ø fault on Transmission circuit with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   c. 3Ø fault on transformer with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   d. 3Ø fault on bus section with stuck breaker[10] ~~or a relay failure[13]~~ resulting in Delayed Fault Clearing.
   e. 3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.
   f. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	g. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. h. 3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. ~~e.~~i. 3Ø internal breaker fault. ~~f.~~j. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.
13. ~~Applies~~For purposes of this standard, non-redundant components of a Protection System to ~~the following~~consider are as follows: a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system associated with protective functions~~ or types: pilot (#85), distance (#21), differential (#87), current (#50, 51,~~, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (an exception is a single communications system that is both monitored and ~~67),~~reported at a Control Center); c. A single station dc supply associated with protective functions required for Normal Clearing (an exception is a single station dc supply that is both monitored and reported at a Control Center for both low voltage ~~(#27 & 59), directional (#32, & 67), and tripping (#86, & 94).~~and open circuit); d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices, required for Normal Clearing (the trip coil may be excluded if it is both monitored and reported at a Control Center).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. .The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:

   a. The estimated number and type of customers affected
   b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community
3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
   a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
   b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

~~C. Measures~~

~~M1.~~ ~~Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.~~

~~M2.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.~~

~~M3.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.~~

~~M4.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.~~

~~M5.~~M1. ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.~~

~~M6.~~ ~~Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.~~

~~M7.~~ ~~Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.~~

~~Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.~~

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the fourth draft of the proposed standard.

Completed Actions	Date
Standards Committee authorized Standard Authorization Request (SAR) for posting	October 29, 2015
SAR posted for comment	May 26 – June 24, 2016
Informal comment period	April 25 – May 24, 2017
45-day formal comment period with initial ballot	September 8 – October 23, 2017
45-day formal comment period with additional ballot	February 23 – April 23, 2018
45-day formal comment period with additional ballot	July 30 – September 14, 2018

Anticipated Actions	Date
10-day final ballot	October 2018
Board adoption	November 2018

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

A. Introduction

1. **Title:** **Transmission System Planning Performance Requirements**

2. **Number:** **TPL-001-5**

3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.

4. **Applicability:**

   4.1. Functional Entity

   4.1.1. Planning Coordinator.

   4.1.2. Transmission Planner.

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-032 standard, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

1.1. System models shall represent:

1.1.1. Existing Facilities.

1.1.2. New planned Facilities and changes to existing Facilities.

1.1.3. Real and reactive Load forecasts.

1.1.4. Known commitments for Firm Transmission Service and Interchange.

1.1.5. Resources (supply or demand side) required for Load.

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within its respective area, using data consistent with MOD-032 including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short

circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:

2.1.1. System peak Load for either Year One or year two, and for year five.

2.1.2. System Off-Peak Load for one of the five years.

2.1.3. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of known Transmission outages.

2.1.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P0 and P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum known outages expected to produce more severe System impacts on the Planning C~~c~~oordinator or Transmission Planner~~s~~’s portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an~~The~~ analysis shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic Load model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.4.4. When known outage(s) of generation or Transmission Facility(ies) are planned in the Near-Term Planning Horizon, the impact of selected known outages on System performance shall be assessed. These known outage(s) shall be selected for assessment consistent with a documented outage coordination procedure or technical rationale by the Planning Coordinator or Transmission Planner. Known outage(s) shall not be excluded solely based upon outage duration. The assessment shall be performed for the P1 categories identified in Table 1 with the System peak or Off-Peak conditions that the System is expected to experience when the known outage(s) are planned. This assessment shall include, at a minimum, those known outages expected to produce more severe System impacts on the Planning Coordinator or Transmission Planner's portion of the BES. Past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1.

2.4.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. Based upon this assessment, an analysis shall be performed for the selected P1 and P2 category events identified in Table 1 for which the unavailability is expected to produce more severe System impacts on its portion of the BES. The analysis shall simulate the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part2.6 and shall include documentation to support the technical rationale for determining material changes.

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.3 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation, modification, or removal of Protection Systems or Remedial Action Schemes.
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
- Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- Use of rate applications, DSM, new technologies, or other initiatives.

2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the

Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.

2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

M2. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.

3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

3.3. Contingency analyses for Requirement R3, Parts 3.1 and 3.2 shall:

3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.

3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

3.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

M3. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power

system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information

M4. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.

R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M6. Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for

performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

C. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data identified in Measures M1 through M8 or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

1.4. Compliance Monitoring Period and Reset Timeframe:

Not applicable.

1.5. Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checks
- Compliance Violation Investigations
- Self-Report
- Complaints

1.6. Additional Compliance Information:

None.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.5.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.5. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-032 standard~~s~~ and other sources, including items represented in the Corrective Action Plan.
R2.	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform studies as specified in Requirement R3, Part 3.2 to assess the impact of extreme events.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform Contingency analysis as described in Requirement R3, Part 3.3.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1. OR The responsible entity did not perform studies to determine that the BES meets the performance requirements for the P0 or P1 categories in Table 1. OR The responsible entity did not base its studies on computer simulation models using data provided in Requirement R1.
R4.	The responsible entity did not identify planning events as described in Requirement R4, Part 4.4 or extreme events as described in Requirement R4, Part 4.5.	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for one of the categories (P1 through P7) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for two of the categories (P1 through P7) in Table 1. OR	The responsible entity did not perform studies as specified in Requirement R4, Part 4.1 to determine that the BES meets the performance requirements for three or more of the categories (P1 through P7) in Table 1. OR

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata
0.1	October 29, 2008	BOT adopted errata changes; updated version number to "0.1"	Errata
0.1	May 13, 2009	FERC Approved – Updated Effective Date and Footer	Revised
1	Approved by Board of Trustees February 17, 2011	Revised footnote 'b' pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)
2	August 4, 2011	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision
2	August 4, 2011	Adopted by Board of Trustees	
1	April 19, 2012	FERC issued Order 762 remanding TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1. FERC also issued a NOPR	

Version	Date	Action	Change Tracking
		proposing to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	
3	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-3 was created after the Board of Trustees approved the revised footnote ‘b’ in TPL-002-2b, which was balloted and appended to: TPL-001-0.1, TPL-002-0b, TPL-003-0a, and TPL-004-0.	
4	February 7, 2013	Adopted by the NERC Board of Trustees. TPL-001-4 was adopted by the Board of Trustees as TPL-001-3, but a discrepancy in numbering was identified and corrected prior to filing with the regulatory agencies.	
4	October 17, 2013	FERC Order issued approving TPL-001-4 (Order effective December 23, 2013).	
4	May 7, 2014	NERC Board of Trustees adopted change to VRF in Requirement 1 from Medium to High.	Revision
4	November 26, 2014	FERC issued a letter order approving change to VRF in Requirement 1 from Medium to High.	
5	TBD	Adopted by the NERC Board of Trustees.	Revised To address reliability issues as identified in FERC Order No. 754 and Order No. 786 directives and update the references to the MOD Reliability Standards in TPL-001.

Table 1 – Steady State & Stability Performance Planning Events
Steady State & Stability: a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0. c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. d. Simulate Normal Clearing unless otherwise specified. e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. **Steady State Only**: f. Applicable Facility Ratings shall not be exceeded. g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. h. Planning event P0 is applicable to steady state only. i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements. **Stability Only :** j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault [7]	N/A	EHV, HV	No[9]	No[12]
		2. Bus Section Fault	SLG	EHV	No[9]	No
				HV	Yes	Yes
		3. Internal Breaker Fault[8] (non-Bus-tie Breaker)	SLG	EHV	No[9]	No
				HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker)[8]	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments[9]	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6]	3Ø	EHV, HV	No[9]	No[12]
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency *(Fault plus stuck breaker[10])*	Normal System	Loss of multiple elements caused by a stuck breaker[10](non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker[10] (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P5 Multiple Contingency *(Fault plus non-redundant component of a Protection System failure to operate)*	Normal System	Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System[13] protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer[5] 4. Shunt Device[6] 5. Bus Section	SLG	EHV	No[9]	No
				HV	Yes	Yes
P6 Multiple Contingency *(Two overlapping singles)*	Loss of one of the following followed by System adjustments.[9] 1. Transmission Circuit 2. Transformer [5] 3. Shunt Device[6] 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer[5] 3. Shunt Device[6]	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes

Category	Initial Condition	Event [1]	Fault Type [2]	BES Level [3]	Interruption of Firm Transmission Service Allowed [4]	Non-Consequential Load Loss Allowed
P7 Multiple Contingency *(Common Structure)*	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure [11] 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.

b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
   a. Loss of a tower line with three or more circuits.[11]
   b. Loss of all Transmission lines on a common Right-of-Way[11].
   c. Loss of a switching station or substation (loss of one voltage level plus transformers).
   d. Loss of all generating units at a generating station.
   e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
   a. Loss of two generating stations resulting from conditions such as:
      i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
   a. 3Ø fault on generator with stuck breaker[10] resulting in Delayed Fault Clearing.
   b. 3Ø fault on Transmission circuit with stuck breaker[10] resulting in Delayed Fault Clearing.
   c. 3Ø fault on transformer with stuck breaker[10] resulting in Delayed Fault Clearing.
   d. 3Ø fault on bus section with stuck breaker[10] resulting in Delayed Fault Clearing.
   e. 3Ø fault on generator with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.
   f. 3Ø fault on Transmission circuit with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing.

ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances.	g. 3Ø fault on transformer with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. h. 3Ø fault on bus section with failure of a non-redundant component of a Protection System[13] resulting in Delayed Fault Clearing. i. 3Ø internal breaker fault. j. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. 6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground. 7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point. 8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker. 9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. 10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. 11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less. 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction. 13. For purposes of this standard, non-redundant components of a Protection System to consider are as follows:

Table 1 – Steady State & Stability Performance Footnotes (Planning Events and Extreme Events)
a. A single protective relay which responds to electrical quantities, without an alternative (which may or may not respond to electrical quantities) that provides comparable Normal Clearing times; b. A single communications system associated with protective functions, necessary for correct operation of a communication-aided protection scheme required for Normal Clearing (an exception is a single communication system that is both -monitored and reported at a Control Center ~~shall not be considered non-redundant~~); c. A single station dc supply associated with protective functions required for Normal Clearing, (an exception is a single station dc supply that is both monitored and reported at a Control Center for both low voltage and open circuit ~~shall not be considered non-redundant~~); d. A single control circuitry (including auxiliary relays and lockout relays) associated with protective functions, from the dc supply through and including the trip coil(s) of the circuit breakers or other interrupting devices required for Normal Clearing (~~except a single~~the trip coil may be excluded if it ~~that~~ is both monitored and reported at a Control Center ~~shall not be considered non-redundant~~).

Attachment 1

I. Stakeholder Process

During each Planning Assessment before the use of Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in the Near-Term Transmission Planning Horizon of the Planning Assessment, the Transmission Planner or Planning Coordinator shall ensure that the utilization of footnote 12 is reviewed through an open and transparent stakeholder process. The responsible entity can utilize an existing process or develop a new process. The process must include the following:

1. Meetings must be open to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues
2. Notice must be provided in advance of meetings to affected stakeholders including applicable regulatory authorities or governing bodies responsible for retail electric service issues and include an agenda with:
    a. Date, time, and location for the meeting
    b. Specific location(s) of the planned Non-Consequential Load Loss under footnote 12
    c. Provisions for a stakeholder comment period
3. Information regarding the intended purpose and scope of the proposed Non-Consequential Load Loss under footnote 12 (as shown in Section II below) must be made available to meeting participants
4. A procedure for stakeholders to submit written questions or concerns and to receive written responses to the submitted questions and concerns
5. A dispute resolution process for any question or concern raised in #4 above that is not resolved to the stakeholder's satisfaction

An entity does not have to repeat the stakeholder process for a specific application of footnote 12 utilization with respect to subsequent Planning Assessments unless conditions spelled out in Section II below have materially changed for that specific application.

II. Information for Inclusion in Item #3 of the Stakeholder Process

The responsible entity shall document the planned use of Non-Consequential Load Loss under footnote 12 which must include the following:

1. Conditions under which Non-Consequential Load Loss under footnote 12 would be necessary:
    a. System Load level and estimated annual hours of exposure at or above that Load level
    b. Applicable Contingencies and the Facilities outside their applicable rating due to that Contingency
2. Amount of Non-Consequential Load Loss with:

a. The estimated number and type of customers affected
b. An explanation of the effect of the use of Non-Consequential Load Loss under footnote 12 on the health, safety, and welfare of the community

3. Estimated frequency of Non-Consequential Load Loss under footnote 12 based on historical performance
4. Expected duration of Non-Consequential Load Loss under footnote 12 based on historical performance
5. Future plans to alleviate the need for Non-Consequential Load Loss under footnote 12
6. Verification that TPL Reliability Standards performance requirements will be met following the application of footnote 12
7. Alternatives to Non-Consequential Load Loss considered and the rationale for not selecting those alternatives under footnote 12
8. Assessment of potential overlapping uses of footnote 12 including overlaps with adjacent Transmission Planners and Planning Coordinators

<u>III. Instances for which Regulatory Review of Non-Consequential Load Loss under Footnote 12 is Required</u>

Before a Non-Consequential Load Loss under footnote 12 is allowed as an element of a Corrective Action Plan in Year One of the Planning Assessment, the Transmission Planner or Planning Coordinator must ensure that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12 if either:

1. The voltage level of the Contingency is greater than 300 kV
    a. If the Contingency analyzed involves BES Elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed Contingency determines the stated performance criteria regarding allowances for Non-Consequential Load Loss under footnote 12, or
    b. For a non-generator step up transformer outage Contingency, the 300 kV limit applies to the low-side winding (excluding tertiary windings). For a generator or generator step up transformer outage Contingency, the 300 kV limit applies to the BES connected voltage (high-side of the Generator Step Up transformer)
2. The planned Non-Consequential Load Loss under footnote 12 is greater than or equal to 25 MW

Once assurance has been received that the applicable regulatory authorities or governing bodies responsible for retail electric service issues do not object to the use of Non-Consequential Load Loss under footnote 12, the Planning Coordinator or Transmission Planner must submit the information outlined in items II.1 through II.8 above to the ERO for a determination of whether there are any

Adverse Reliability Impacts caused by the request to utilize footnote 12 for Non-Consequential Load Loss.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2015-10 Single Points of Failure
Reliability Standard TPL-001-5

Applicable Standard(s)

- TPL-001-5 – Transmission System Planning Performance Requirements

Requested Retirement(s)

- TPL-001-4 – Transmission System Planning Performance Requirements

Prerequisite Standard(s)
None

Applicable Entities

- Planning Coordinator
- Transmission Planner

Background
Reliability Standard TPL-001-5 revises the prior version of the TPL-001 standard in three key respects:

- To address reliability issues concerning the study of single points of failure in Protection Systems, as identified in:
  - Federal Energy Regulatory Commission (FERC) Order No. 754, issued on September 15, 2011; and
  - the report dated September 2015 by two subcommittees under NERC Planning Committee , the System Protection and Control Subcommittee and System Analysis and Modeling Subcommittee, titled *Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request;*
- To address directives from FERC Order No. 786 (October 17, 2013) approving Reliability Standard TPL-001-4, relating to:
  - modeling known outages with a duration of less than six months (paragraph 40); and
  - adding stability analysis for the outage of major Transmission equipment with a lead time of one year or more (paragraph 89); and;
- To replace references to the Reliability Standards MOD-010 and MOD-012, which have been superseded by MOD-032.

General Considerations

The standard will become effective 36 months following regulatory approval. The 36-month period provides time for Planning Coordinators and Transmission Planners to develop, among other things:

- A procedure or technical rationale for selecting known outages of generation and Transmission Facilities;
- Coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis required by the standard; and
- Additional analysis required due to changes in the standard.

Following this 36 month period, an additional 24-month period allows time for the development of Corrective Action Plans (CAPs) under TPL-001-5 for Category P5 planning events involving single points of failure in Protection Systems.

Transmission Planners and Planning Coordinators shall have an additional 48 months beyond the time by which CAPs must be developed to comply with the bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **<u>but the planned System shall continue to meet the performance requirements in Table 1</u>**" for P5 planning events for non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d.

This implementation plan reflects consideration that Planning Coordinators and Transmission Planners will need time to conduct the new studies and analyses in order to coordinate with asset owners and protection engineers to identify appropriate CAP actions and establish the associated timetables for completion. This includes any necessary CAP(s) to address System performance issues for studies involving Table 1 Category P5 (Fault plus non-redundant component of a Protection System failure to operate) required by TPL-001-5 Requirement R2, Part 2.7 for the non-redundant components of a Protection System identified in TPL-001-5 Table 1 Footnote 13.

Please see Figure 1 Implementation Timeline below for an illustration of the 108-month implementation timeline in those jurisdictions where governmental approval is required.

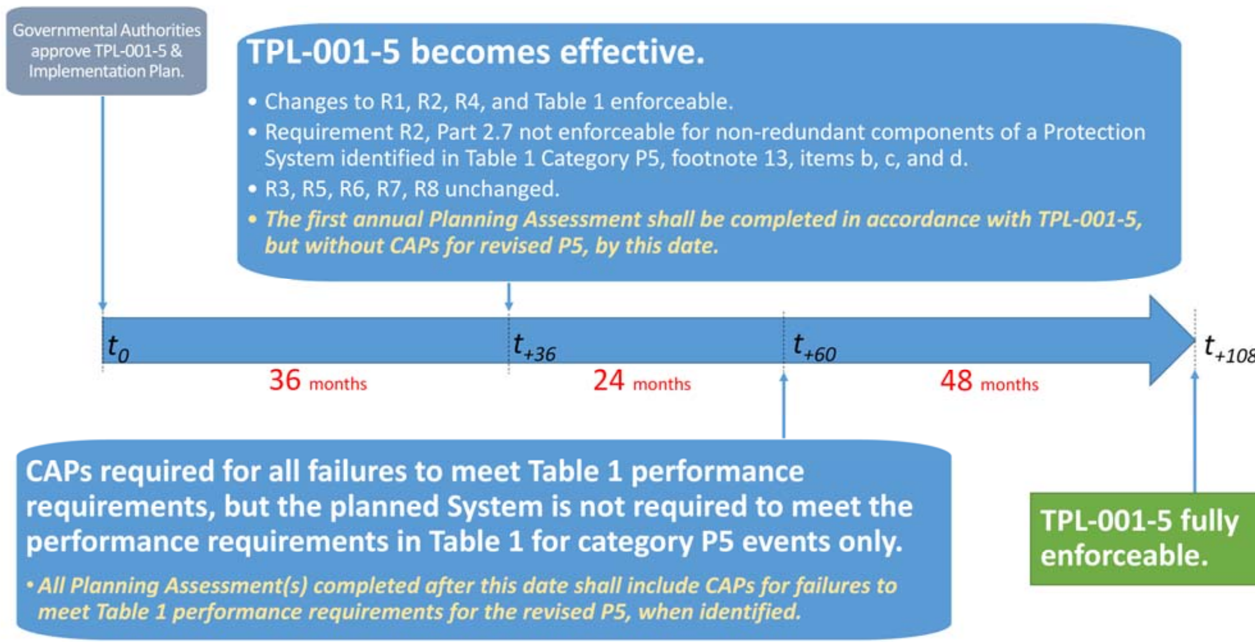

Figure 1 Implementation Plan Timeline

Effective Date

TPL-001-5 – Transmission System Planning Performance Requirements

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for TPL-001-5 Requirement 2, Part 2.7 associated with Table 1 Category P5 Footnote 13 items a, b, c, and d

Entities shall not be required to comply with Requirement R2, Part 2.7 for the Table 1 Category P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d until 24 months after the effective date of Reliability Standard TPL-001-5.

For CAPs developed to address failures to meet Table 1 performance requirements for the P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d, entities shall not be required to comply until 72 months after the effective date of Reliability Standard TPL-001-5 with the bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1.**"

Initial Performance of Periodic Requirements

Each responsible entity shall complete the first annual Planning Assessment in accordance with TPL-001-5 (without CAP(s) for the revised P5 planning event) by the effective date of the standard.

Each responsible entity shall develop any required CAP(s) under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13 items a, b, c, and d by 24 months after the effective date of the standard.

Retirement Date

TPL-001-4 – Transmission System Planning Performance Requirements

Reliability Standard TPL-001-4 shall be retired immediately prior to the effective date of TPL-001-5 in the particular jurisdiction in which the revised standard is becoming effective.

Background
Reliability Standard TPL-001-5 revises the prior version of the TPL-001 standard in three key respects:

- To address reliability issues concerning the study of single points of failure ~~on~~in Protection Systems, as identified in~~-~~:
  - o Federal Energy Regulatory Commission (FERC) Order No. 754, issued on September 15, 2011~~,~~; and
  - o the report dated September 2015 by two subcommittees under NERC Planning Committee , the System Protection and Control Subcommittee and System Analysis and Modeling Subcommittee~~ September 2015 report~~, titled *Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request;*
- To address directives from FERC Order No. 786 ~~issued~~ (October 17, 2013~~, in which FERC approved~~) approving Reliability Standard TPL-001-4, relating to:
  - o modeling known outages with a duration of less than six months~~;~~ (paragraph 40); and
  - o adding stability analysis for the outage of major Transmission ~~E~~equipment with a lead time of one year or more~~.~~ (paragraph 89); and;
- To replace references to the Reliability Standards MOD-010 and MOD-012~~ standards~~, which have been superseded by ~~the~~ MOD-032~~ Reliability Standard~~.

General Considerations

RELIABILITY CORPORATION

~~This implementation plan provides 36 months until the~~The standard will become effective ~~date of the Standard, providing~~36 months following regulatory approval. The 36-month period provides time for Planning Coordinators and Transmission Planners ~~with time to update their annual Planning Assessments to include the new System models and studies required by the standard. This implementation period reflects consideration that Planning Coordinators and Transmission Planners will need time~~ to develop, among other things:

- A procedure or technical rationale for selecting known outages of generation and Transmission Facilities;
- ~~A process for establishing coordination~~Coordination with protection engineers to obtain the necessary data to perform the single points of failure analysis required by the standard; and
- Additional ~~base case models and~~ analysis~~.~~ required due to changes in the standard.

~~In addition,~~
Following this ~~implementation plan includes~~36 month period, an additional 24-month period allows time for the development of Corrective Action Plans (CAPs) under TPL-001-5 ~~to address newly-added studies~~ for Category P5~~ and P8~~ planning events involving single points of failure ~~on~~in Protection Systems.

~~This extended implementation period for the~~Transmission Planners and Planning Coordinators shall have an additional 48 months beyond the time by which CAPs must be developed to comply with the bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall continue to meet the performance requirements in Table 1**", ~~acknowledges that failures to meet System performance requirements, identified during subsequent Planning Assessment(s), for single points of failure in Protection Systems may not be mitigated by an Operating Procedure during an interim period before a mitigating capital improvement is installed~~" for P5 planning events for non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d.

This implementation ~~period~~plan reflects consideration that Planning Coordinators and Transmission Planners will need time ~~beyond that provided~~ to conduct the new studies and ~~analysis~~analyses in order to ~~develop processes for coordination~~coordinate with asset owners and protection engineers to identify appropriate CAP actions and establish the associated timetables for completion. This includes any necessary CAP(s) to address System performance issues for studies involving Table 1 Category P5~~ and P8 Multiple Contingency~~ (Fault plus non-redundant component of a Protection System failure to operate) required by TPL-001-5 Requirement R2, Part 2.7 for the non-redundant components of a Protection System identified in TPL-001-5 Table 1 Footnote 13.

~~Lastly, the provisions related to CAP including Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3) are carried forward from the TPL-001-4 implementation plan.~~
Please see Figure 1 Implementation Timeline below for an illustration of the 108-month implementation timeline in those jurisdictions where governmental approval is required.

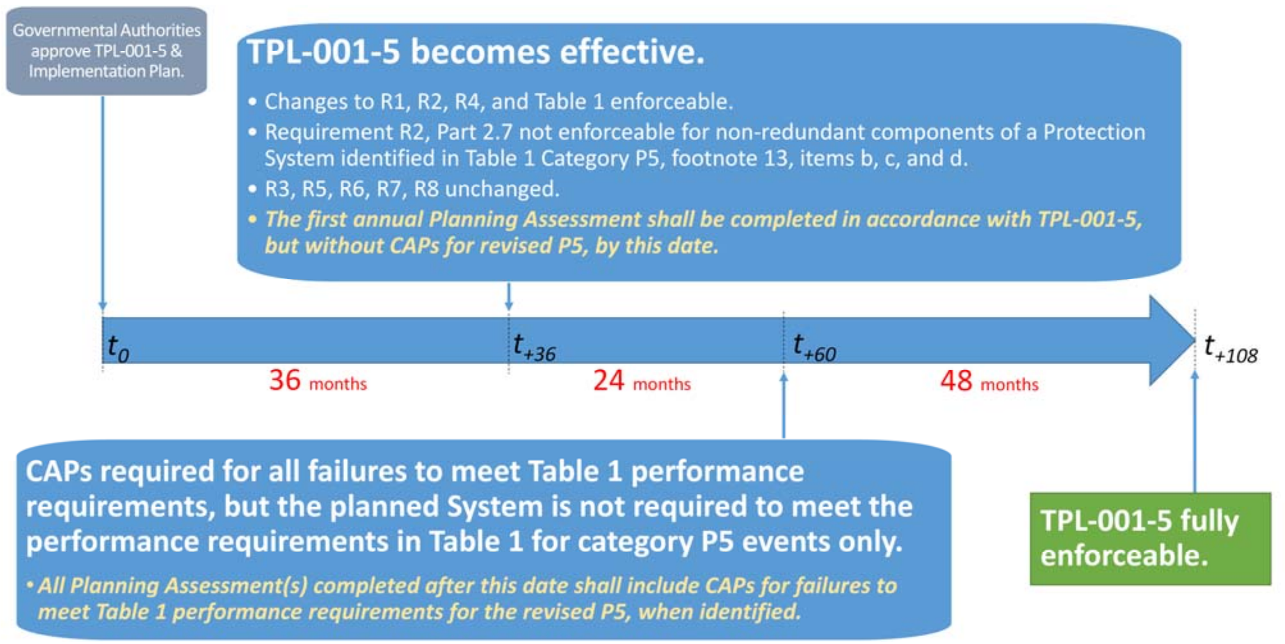

Figure 1 Implementation Plan Timeline

Effective Date

TPL-001-5 – Transmission System Planning Performance Requirements

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 36 months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for TPL-001-5 Requirement 2, Part 2.7 associated with Table 1 Category P5 Footnote 13 items a, b, c, and d ~~and P8~~

Entit~~l~~ies shall not be required to comply with Requirement R2, Part 2.7 for the Table 1 Category P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and d ~~or P8~~ until 24 months after the effective date of Reliability Standard TPL-001-5.

For CAPs developed to address failures to meet Table 1 performance requirements for ~~P5 or P8 events only, Transmission Planners~~the P5 planning event for the non-redundant components of a Protection System identified in footnote 13 items a, b, c, and ~~Planning Coordinators~~d, entities shall not be required to comply until 72 months after the effective date of Reliability Standard TPL-001-5 with the ~~section~~bolded part of Requirement R2, Part 2.7 that states: "Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments **but the planned System shall** continue to meet the performance requirements in Table 1~~", until 96 months after the effective date of Reliability Standard TPL-001-5.~~."

~~**Note Regarding CAPs**~~
~~For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval of TPL-001-4, or in those jurisdictions where regulatory approval is not required on the first day of the first calendar quarter 84 months after Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, CAP applying to the following categories of Contingencies and events identified in TPL-001-5, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-5:~~

- ~~P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)~~
- ~~P2-1~~
- ~~P2-2 (above 300 kV)~~
- ~~P2-3 (above 300 kV)~~
- ~~P3-1 through P3-5~~
- ~~P4-1 through P4-5 (above 300 kV)~~
- ~~P5 (above 300 kV)~~

Initial Performance of Periodic Requirements

Each responsible entity shall complete the first annual Planning Assessment ~~without CAPs for revised P5 or P8~~ in accordance with TPL-001-5 (without CAP(s) for the revised P5 planning event) by the effective date of the standard.

Each responsible entity shall develop any required CAP(s) under Requirement R2, Part 2.7 associated with the non-redundant components of a Protection System identified in Table 1 Category P5 Footnote 13 items a, b, c, and d ~~and P8~~ by 24 months after the effective date of ~~Reliability Standard TPL-001-5~~the standard.

Retirement Date

TPL-001-4 – Transmission System Planning Performance Requirements

Reliability Standard TPL-001-4 shall be retired immediately prior to the effective date of TPL-001-5 in the particular jurisdiction in which the revised standard is becoming effective.

Violation Risk Factor and Violation Severity Level Justifications

Project 2015-10 Single Points of Failure TPL-001

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for Requirement R4 in Project 2015-10 and Single Points of Failure TPL-001. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards

FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification for TPL-001-5, Requirement R1

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R1

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R2

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R2

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R3

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R3

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R4

The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R4

The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R5
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R5
The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R6
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VSL Justification for TPL-001-5, Requirement R6
The VSL did not change from the previously FERC approved TPL-001-4 Reliability Standard.

VRF Justification for TPL-001-5, Requirement R7
The VRF did not change from the previously FERC approved TPL-001-4 Reliability Standard.

Preface

The vision for the Electric Reliability Organization (ERO) Enterprise, which is comprised of the North American Electric Reliability Corporation (NERC) and the seven Regional Entities (REs), is a highly reliable and secure North American bulk power system (BPS). Our mission is to assure the effective and efficient reduction of risks to the reliability and security of the grid.

The North American BPS is divided into seven RE boundaries as shown in the map and corresponding table below. The multicolored area denotes overlap as some load-serving entities participate in one Region while associated Transmission Owners/Operators participate in another.

Executive Summary

Project 2015-10 Technical Rationale provides the background and rationale for proposed revisions to Reliability Standard TPL-001-4. The proposed revisions address reliability issues concerning the study of single points of failure (SPF) on Protection Systems from FERC Order No. 754, directives from FERC Order No. 786 regarding planned maintenance outages and stability analysis for spare equipment strategy , and replaces references to the MOD-010 and MOD-012 standards with the MOD-032 Reliability Standard.

Key Concepts of FERC Order No. 754

The Standard Drafting Team (SDT) took into account the recommendations for modifying NERC Reliability Standard TPL-001-4 identified in both the SPCS and SAMS report titled *Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request* and the *Informational Filing of the North American Electric Reliability Corporation in Response to Order No. 754* to the FERC. In "Table 1 – Steady State and Stability Performance Planning Events," the Category P5 event incorporates Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System. In "Table 1 – Steady State and Stability Performance Extreme Events," breaker failure and failure of a non-redundant component of a Protection System are differentiated. The SDT recognizes that sequence and timing of Protection System action leading to Delayed Fault Clearing may be quite different between the two causalities, and also that fault severity and acceptable consequence of failure of a non-redundant component of a Protection System should be differentiated. Footnote 13 of the "Table 1 – Steady State & Stability Performance Footnotes" describes the non-redundant Protection System components to be considered for Category P5 Planning Events and Stability Extreme Events.

Key Concepts of FERC Order No. 786

The SDT considered the Commission's concern that the outages of significant facilities less than six months could be overlooked for planning purposes, that Category P3 and P6 do not sufficiently cover planned maintenance outages, and the Near-Term Transmission Planning Horizon requires annual assessments using Year One or year two, and year five, and known planned facility outages of less than six months should be addressed so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon. Proposed revisions remove the six month outage duration, shift the consideration of known outages from Requirement R1, which requires what System models shall represent, to Requirement R2, Parts 2.1 and 2.4, which require the study and assessment of known outages. Further, proposed revisions include a requirement to document an outage coordination procedure or the technical rationale for the determination of which known outages to study. Proposed revisions also included the addition of stability assessment for long lead equipment that does not have a spare.

Summary of proposed revisions

- Requirement R1 – Updated for MOD-032-1 standard.
- Requirement R1, Part 1.1.2 – Removed this requirement.
- Requirement R2, Part 2.1.4 – Added model conditions for steady state analysis of P0 and P1 events for known outages.
- Requirement R2, Part 2.4.4 – Added model conditions for stability analysis of P1 events for known outages.
- Requirement R2, Part 2.4.5 – Added stability analysis requirement for long lead time equipment unavailability.
- Requirement R3, Part 3.2 – Document internal conforming clean-up to incorporate the last sentence of Part 3.5.

- Requirement R4, Part 4.2 – Document internal conforming clean-up to incorporate the last sentence of Part 4.5.
- Table 1 – Modified Category P5 event to include SPF.
- Table 1 – Modified Extreme Events, Stability column to differentiate SPF from stuck breaker.
- Table 1 – Modified Footnote 13 to specify the SPF that should be considered.

Introduction

NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) is being modified to address reliability issues and standard modification directives contained in FERC Order No. 754[1] and FERC Order No. 786.[2] Proposed Reliability Standard TPL-001-5 revises the TPL-001 standard to address the reliability risks posed by SPF on Protection Systems.

Background

FERC Order No. 754

FERC Order No. 754 directed NERC to study the reliability risk associated with SPF in Protection Systems. As a follow-up to a NERC Technical Conference where the risks and concerns associated with SPF were discussed, the NERC System Protection and Control Subcommittee (SPCS) and the System Analysis and Modelling Subcommittee (SAMS) conducted an assessment of Protection System SPF in response to FERC Order No. 754, including analysis of data collected pursuant to a request for data or information under Section 1600 of the NERC Rules of Procedure. The SPCS and SAMS report titled *Order No. 754 Assessment of Protection System Single Points of Failure Based on the Section 1600 Data Request* and the *Informational filing of the North American Electric Reliability Corporation in Response to Order No. 754* to the FERC provide extensive general discussion about the reliability risks associated with a SPF.

The SDT strongly considered the recommendations of the SPCS and SAMS report, recognizing that the purpose of that report was to determine whether a reliability concern existed demanding NERC to address the study of SPF on Protection Systems. The formation of the Project 2015-10 directly resulted from the SPCS and SAMS report recommendations. However, the SDT's obligation was to consider the reported recommendations and translate them into proposed TPL-001-5 Reliability Standard requirements that are meaningful to Planning Coordinators and Transmission Planners for performance of annual TPL Planning Assessments which adequately account for the reliability risk posed by SPF on Protection Systems.

FERC Order No. 786

In FERC Order No. 786, FERC directed NERC to address two issues. The first issue is the concern that the six month outage duration threshold could exclude planned maintenance outages of significant facilities from future planning assessments. FERC directed NERC to modify TPL-001-4 to address this concern. The second issue involves adding clarity regarding dynamic assessment of outages of critical long lead time equipment, consistent with the entity's spare equipment strategy. FERC directed NERC to consider this issue upon its next review of TPL-001-4. The NERC SAMS developed a white paper documenting the technical analysis conducted by SAMS to address the two directives contained in the FERC Order No. 786. The white paper provides extensive general discussion regarding the directives.

Section 1: Single Points of Failure on Protection Systems (FERC Order No. 754)

NERC Advisory

On March 30, 2009, NERC issued an advisory[3] report notifying the industry that a SPF issue had caused three significant system disturbances in 5 years.

Transmission Owners, Generation Owners, and Distribution Providers owning Protection Systems installed on the Bulk Electric System (BES) were advised to address SPF on their Protection Systems when identified in routine system evaluations to prevent N-1 transmission system contingencies from evolving into more severe or even extreme events.

These entities were additionally advised to begin preparing an estimate of the resource commitment required to review, re-engineer, and develop a workable outage and construction schedule to address SPF on their Protection Systems.

FERC Order No. 754

In FERC Order No. 754 Paragraph 20, FERC directed NERC to "to make an informational filing within six months of the date of the issuance of this Final Rule explaining whether there is a further system protection issue that needs to be addressed and, if so, what forum and process should be used to address that issue and what priority it should be accorded relative to other reliability initiatives planned by NERC."

FERC Technical Conference

A FERC technical conference concerning the Commission's Order 754 titled Staff Meeting on Single Points of Failure on Protection Systems was held on October 24-25, 2011 at FERC in Washington, DC.

At the technical conference, the attendees discussed the SPF issue and narrowed their concerns into four consensus points:

- The concern with assessment of SPF is a performance-based issue, not a full redundancy issue.
- The existing approved standards address assessments of SPF.
- Assessments of SPF of non-redundant primary protection (including backup) systems need to be sufficiently comprehensive.
- Lack of sufficiently comprehensive assessments of non-redundant primary Protection Systems is a reliability concern.

Joint SPCS-SAMS Report

One outcome of the FERC technical conference was that NERC would conduct a data collection effort to provide a broad factual foundation that could aid in assessing the reliability risks posed by SPF. The NERC Board of Trustees approved the request for data or information under Section 1600 of the NERC Rules of Procedure ("Order No. 754 Data Request") on August 16, 2012.

In September 2015, SPCS and SAMS issued a report to the NERC Planning Committee (PC) and Operating Committee (OC), summarizing the information collected under the Order No. 754 Data Request. The assessment confirmed the existence of a reliability risk associated with SPF in Protection Systems that warrants further action.

---

[3] *See [Industry Advisory: Single Point of Failure](http://www.nerc.com/files/Final_Order_754_Informational_Filing_3-15-12_complete.pdf)*
http://www.nerc.com/files/Final_Order_754_Informational_Filing_3-15-12_complete.pdf

To address this risk, the SPCS and the SAMS considered a variety of alternatives and concluded that the most appropriate recommendation that aligns with FERC Order No. 754 directives and maximizes reliability of Protection System performance is to modify NERC Reliability Standard TPL-001-4 (Transmission System Planning Performance Requirements) through the NERC standards development process.

The SDT strongly considered the recommendations of the SPCS and SAMS report, as specified by the Project 2015-10 Single Points of Failure Standards Authorization Request (SAR). The SDT recognized that its obligation was to consider the reported recommendations and translate them into proposed TPL-001-5 Reliability Standard requirements that are meaningful to Planning Coordinators and Transmission Planners for performance of annual TPL Planning Assessments. The SPCS and SAMS report recommendations, as well as how they have been addressed in proposed TPL-001-5 by the Project 2015-10 SDT are summarized in the following section.

Revisions to TPL-001-4

Single Points of Failure – Category P5 Planning Events

The SPCS and SAMS report states, "Analysis of the data demonstrates the existence of a reliability risk associated with single points of failure in protection systems that warrants further action. The analysis shows that the risk from single point of failure is not an endemic problem and instances of single point of failure exposure are lower on higher voltage systems. However, the risk is sufficient to warrant further action. Risk-based assessment should be used to identify protection systems of concern (i.e., locations on the BES where there is a susceptibility to cascading if a protection system single point of failure exists)".

The modifications to the Category P5 Planning event description are intended to be aligned with the changes to the Table 1, Footnote 13. The SDT has modified Table 1, Footnote 13 to capture the SPCS/SAMS recommendations for Category P5 events, which expands beyond the previously limited set of relays identified in TPL-001-4, to capture the identified SPF of concern. Footnote 13 describes the non-redundant Protection System components to be considered for Category P5 Planning Events, and is discussed further below.

The Table 1 Category P5 event describes a Contingency where a single line-to-ground (SLG) fault occurs and Delayed Fault Clearing results due to the failure of the Protection System, protecting the Faulted element, to operate as designed. Typically, the two most important aspects of the P5 event that affect simulation are the magnitude of SLG fault current and the mode of Protection System failure leading to Delayed Fault Clearing. The latter is especially important and the mode of Protection System failure details make the P5 event unique. The Transmission Planner or Planning Coordinator must be cognizant of the time period during which the Protection System removes Elements from service, as well as the sequence of their removal during isolation of the fault. By definition, Normal Clearing is not expected when a non-redundant component of a Protection System is simulated to have failed; the P5 event implies that the Protection System does not operate as designed to clear the SLG fault in the time normally expected with proper functioning of the installed Protection System. Therefore, when a non-redundant component of a Protection System fails, Delayed Fault Clearing results. This means that correct operation of the backup Protection System occurs with the intentionally designed time delay before fault clearing. Additionally, there may be significant differences in final System configuration due to the Protection System operation to clear the faulted Element. For example, more System Elements may be removed from service when the backup Protection System operates, consistent with Delayed Fault Clearing, than may be expected during primary Protection System operation expected for Normal Clearing. The expected time delays for Protection System operation are critical for proper simulation of the P5 event.

It is anticipated that the most cost-effective Corrective Action Plans to address unacceptable system performance for the P5 Planning Events will likely be to add Protection System component redundancy, consistent with the components to be considered in Footnote 13. Protection System redundancy changes to address Category P5

Event concerns should also reduce or even negate non-redundant components that need to be considered in assessing System performance resulting from simulation of the 2e-2h Extreme Events; hence, potentially mitigating many concerns.

Clarification: Why address SPF in TPL-001 and not create a new Reliability Standard for this purpose?

As part of the recommendations from the SPCS and SAMS report, the option to create a new Reliability Standard to address SPF in the Protection System was considered. Both a new TPL standard for planning-related studies and assessment, as well as a new Protection and Control standard to specify Protection System redundancy were debated by SPCS and SAMS. Ultimately, the recommendation of the SPCS and SAMS report, leading to the formation of the Project 2015-10 SDT, focused upon the simulation and study assessment of the Transmission system given non-redundant components of the Protection System instead of mandating a level of redundancy across a diverse set of equipment and utilities in North America.

It is important to emphasize that modifications to the TPL-001-5 Table 1 Category P5 Planning Event, the TPL-001-5 Table 1 Extreme Stability Events, and related changes to Table 1, Footnote 13 do not establish or mandate a level of redundancy for Protection Systems. Quite the contrary: the modifications presented in TPL-001-5 require planning entities to consider the non-redundant components of Protection Systems that may exist within their respective Systems, to execute appropriate studies, and to assess the impacts that these SPF may have upon the ability to meet Table 1 System performance requirements given Delayed Fault Clearing. TPL-001-5 does not mandate redundancy; TPL-001-5 requires that some non-redundancy components of a Protection System be considered during annual Planning Assessments.

Clarification: Why is consideration of fault duration significant for the P5 Planning Event?

A Protection System is designed to isolate faulted equipment within an expected time duration following fault initiation. When the Protection System does not operate as designed or fails to isolate faulted equipment within the time normally expected with its proper functioning, backup protection capabilities must act to clear the fault. The SDT recognized that Protection Systems used for backup protection are designed with intentional time delays that inherently allows primary protection to actuate first. This is consistent with the Table 1 Planning Event P5 which is characterized by its prescribed Delayed Fault Clearing. The SDT recognized that the sequencing, causality, and mode of failure of a non-redundant component of a Protection System leads to Delayed Fault Clearing by the operation of backup protection, whether local (e.g., breaker failure initiation) or remote (e.g., remote-end terminal tripping consistent with zonal backup protection). The SDT believed the existing defined terms Normal Clearing and Delayed Fault Clearing were appropriate for the revised Table 1 Planning Event P5, as well as the revised Table 1 Footnote 13.

Clarification: What is the difference between a top-down versus bottom-up approach to Category P5 Events?

As part of simulating and analyzing results of P5 Event assessments, two common approaches to the Stability portion of simulations may be appropriate for planning entities to undertake. The first, referred to as the top-down approach, may initially focus upon determining critical clearing times for an entity's System topology given SLG faults. Once critical clearing times are obtained, the planning entity has the opportunity to collaborate with System Protection personnel to assess whether the installed Protection System may achieve the required performance. An advantage of the top-down approach is that the analytical burden to determine critical clearing times is front-loaded upon the planning entity and specific details regarding the Protection System are unnecessary prior to executing dynamics simulations. Conversely, the bottom-up approach may commence by the planning entity requesting the detailed causality and clearing times for SPF on the Protection System from Protection System personnel, requiring an extensive review of installed Protection Systems at the outset. While this approach may delay the execution of P5 Event studies, it may eliminate System topology that is not susceptible to SPF on the Protection System based upon Protection System personnel input and reduces the planning entity's dynamics simulation burden. Whether utilizing a top-down, bottom-up, combination of the two, or any other appropriate approach, the obligation specified in Table 1, Footnote 13 is for the planning entity to consider the non-redundant components of a Protection System that may lead to Delayed Fault Clearing when simulating the P5 Event.

Clarification: Is backup protection redundant?

The majority of BES Protection Systems are designed with overlapping zonal protection, including backup systems which eventually clear a fault in the event of a failure of the Protection System which is designed for Normal Clearing. Backup Protection Systems are not redundant for purposes of TPL-001-5 Table 1, Category P5 Events because they result in Delayed Fault Clearing and/or trip more Elements than the primary Protection System designed for Normal Clearing. Where the Protection System is designed with backup protections, the backup protection clearing time for a SLG fault must be the same as the clearing time for the primary Protection System designed for Normal Clearing, and must trip identical Elements, in order for the backup Protection System to be considered redundant to the primary Protection System. The SDT expects this type of design to be rare in its implementation, and correspondingly, backup protection is not considered redundant.

Table 1, Footnote 13

Footnote 13 is included in the TPL-001-5 Reliability Standard for the purpose of focusing the Transmission Planner and Planning Coordinator consideration of non-redundant components of a Protection System that may, when they fail, lead to Delayed Fault Clearing of the SLG fault simulated as part of the P5 event.

The SPCS and SAMS report recommended replacing "relay" with "component of a Protection System" in the Table 1 P5 event and replace Footnote 13 in TPL-001-4 with the following alternate wording:

> The components from the definition of 'Protection System' for the purposes of this standard include (1) protective relays that respond to electrical quantities, (2) single station DC supply that is not monitored for both low voltage and open circuit, with alarms centrally monitored (i.e., reported within 24 hours of detecting an abnormal condition to a location where corrective action can be initiated), and (3) DC control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A factor that the SDT considered when seeking to translate the SPCS and SAMS recommendations into the proposed TPL-001-5 Table 1, Footnote 13 was the need for Planning Coordinators and Transmission Planners to collaborate with System Protection personnel. The SDT recognized that the planning entities do not always have enough information alone to consider Protection System modes of failure or Delayed Fault Clearing than may result. Likewise, the SPCS and SAMS recommendations were adapted to target the potential non-redundant components of a Protection System that may likely need System Protection personnel input when determining how study simulations, performed by the planning entity, should be executed. Based on discussion and industry comment, the SDT revised Footnote 13 to clarify the components of the Protection System that must be considered when simulating Delayed Fault Clearing due to the failure of a non-redundant component of a Protection System. This consideration is intended to account for:

- failed non-redundant components of a Protection System that may impact one or more Protection Systems;
- the duration that faults remain energized until Delayed Fault Clearing, and;

- additional system equipment removed from service following fault clearing depending upon the specific failed non-redundant component of a Protection System.

The SPCS and SAMS report described voltage or current sensing devices as having a lower level of risk of failure to trip due to robustness and likelihood to actually cause tripping upon failure. Therefore, these components of a Protection System are omitted from Footnote 13. Similarly, control circuitry whose failure does not prevent Normal Clearing of a fault, such as reclosing circuitry and reclosing relays, is omitted from Footnote 13 consideration.

Clarification: Does Footnote 13 prescribe redundancy?

It is emphasized that Footnote 13 does not prescribe any level of redundancy; on the contrary, Footnote 13 gives those non-redundant components of a Protection System that shall be considered for simulation of the Table 1 Planning Event P5 and Table 1 Extreme Events Stability column 2e-2h. Further, it is the Table 1 Planning Event P5 which prescribes the required System performance. The consideration of non-redundant components of a Protection System is necessary to properly simulate the Table 1 Planning Event P5 for the purpose of assessing whether required System performance is achieved. If, after proper consideration and simulation, required System performance is achieved, then there may be no impetus to make non-redundant components of a Protection System redundant. On the other hand, after proper consideration and simulation it is demonstrated that required System performance is not achieved, making non-redundant components of a Protection System redundant may be but one of many alternatives for corrective actions to obtain required System performance.

Clarification: Why is monitored and reported to a Control Center used in parts of Footnote 13?

The SDT recognized that some components of a Protection System may be monitored and their integrity reported to a Control Center. Different than an indication of a component failure that may be displayed in a remote site or in a location that may go unnoticed for a period, reporting to a Control Center implies that an unsatisfactory condition would be identified and corrective action be directed in short order. It is noted that short order is consistent with the “within 24 hours of detecting an abnormal condition” recommendation of the SPCS/SAMS report. Given that a risk-based approach to non-redundant components of a Protection System is appropriate, the SDT believed that components that may be SPF but are monitored and reported to a Control Center exhibited lower risk on par with being redundant, and therefore did not warrant P5 Event simulation.

Clarification: Why are relays that respond to electrical quantities addressed?

Noting that Requirement R3, Part 3.3.1 and Requirement R4, Part 4.3.1 require simulation of Protection System action, the SDT sought to limit the scope of Footnote 13a with respect to protective relays that may be non-redundant components of a Protection System. Specifically, Footnote 13 limits single protective relays that may be a SPF to those which respond to electrical quantities and are used for primary protection resulting in Normal Clearing. A SPF in a single protective relay that is a non-redundant component of a Protection System may result in the primary Protection System failing to properly operate, leading to Delayed Fault Clearing performed by backup protective relays and/or overlapping zonal protection. Conversely, the SDT did not include backup protective relays in the scope of Footnote 13a given that a SPF in a single protective relay used for backup protection will not affect primary protection resulting in Normal Clearing.

The SDT recognized that BES Elements are predominantly protected by relays which respond to electrical quantities. However, in some Protection System designs, non-redundant single protective relays which respond to electrical quantities may be redundant to protective relays that do not respond to electrical quantities. For example, an independent differential relay and independent sudden pressure relay may protect the same transformer from faults inside the transformer tank. In this example, the differential relay responds to electrical quantities, while the sudden pressure relay does not. While the transformer differential relay may be a SPF, an internal transformer tank fault may not lead to Delayed Fault Clearing given the sudden pressure protection, provided, in this example, that the resulting clearing time is similar to that achieved with the differential relay. Subsequently, the P5 event, for a single phase-to-ground (line-to-ground) fault in the transformer tank need not be simulated for Delayed Fault Clearing due to the SPF of the transformer differential relay if the resulting clearing time is similar to that achieved with the differential relay. However, care must be taken when evaluating protective relays which respond to electrical quantities in combination with protective relays which do not respond to electrical quantities; in this same example, faults that occurred outside of the transformer tank given the SPF of the non-redundant transformer differential relay would be unaffected by the presence of the sudden pressure relay and would lead to delayed clearing, necessitating its assessment as a P5 event (See Figure 1 and 2).

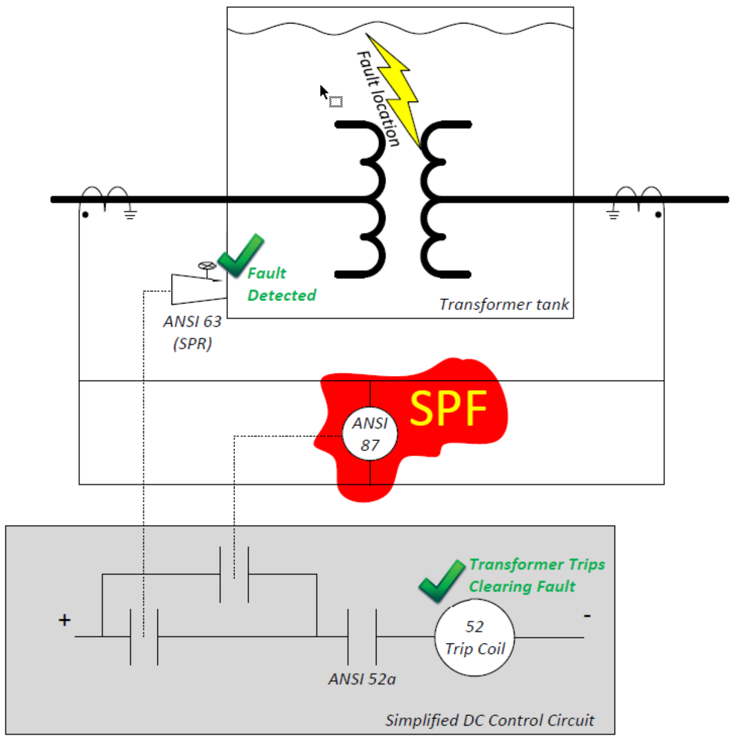

Figure 1: Internal Transformer Tank Fault with Sudden Pressure Protection and failed Transformer Differential Relay

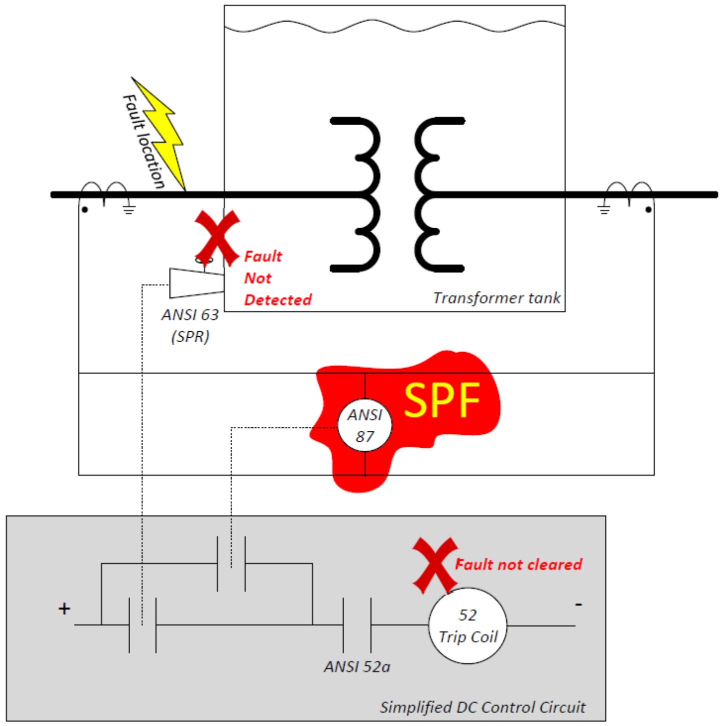

Figure 2: External Transformer Tank Fault with Sudden Pressure Protection and failed Transformer Differential Relay

Clarification: What is comparable and what is not comparable for purposes of footnote 13?

The use of "comparable" in Table 1, Footnote 13a applies only to alternatives for a single protective relay that responds to electrical quantities. For an alternative to be comparable to a single protective relay that responds to electrical quantities, the alternative must operate as designed to clear the fault within the time period expected if the single protective relay (that is simulated to fail as a SPF) were to function properly. Clearly, any alternative to a single protective relay that responds to electrical quantities may result in a different Element tripping sequence, leading to a different System topology after fault clearing which must be considered. Therefore, a comparable alternative to a single protective relay that responds to electrical quantities must result in fault clearing within the expected Normal Clearing time period and isolate the fault by tripping similar System Elements.

Clarification: Are separate Normal Clearing times comparable?

The SDT cannot anticipate all Protection System designs. However, the SDT's intent for alternatives to a single protective relay that responds to electrical quantities is implicit in the principle of comparable Normal Clearing times. In some cases, multiple layers of protection may overlap towards achieving a common System protective objective: to provide Normal Clearing. Examination of this design towards the common objective may indicate the Normal Clearing times are comparable. An example of this type of design may be a piloted relay for high-speed fault clearing used in conjunction with a non-piloted relay for primary or fast fault clearing. While these two relays may have different Normal Clearing times, their protective objective is common: to provide Normal Clearing. The clearing times of these two relays may be different, but are likely comparable. The applicable entity must understand the design of their own Protection System for the purpose of considering non-redundant components. Moreover, determination of whether alternatives, which may or may not respond to electrical quantities, provide comparable Normal Clearing times must be made with regard to the Protection System design, the expected fault clearing time, and the protective objective of its proper functioning.

Clarification: Why are communication-aided Protection Systems addressed?

Given the increasing importance of communication-aided Protection Systems (e.g., pilot protection schemes, direct transfer tripping schemes, permissive transfer tripping schemes, line differential relaying schemes, etc.), the proper operation of the communication system must be considered when considering potential SPF components of Protection Systems. The SDT augmented the SPCS/SAMS recommendations to include reference to the subset of communication systems that are part of a communication-aided Protection System, necessary where the performance of that Protection System is required to achieve Transmission System Planning (TPL) Performance Requirements, enumerated in Table 1 of TPL-001-4. In other words, a communication-aided Protection System that may experience a SPF, causing it to operate improperly or not at all, must be considered as part of non-redundancy. The SDT concluded that, although the failure of communication-aided Protection Systems may take many forms, by monitoring and reporting the status of these systems, the overall risk of impact to the BES can potentially be reduced to an acceptable level. However, monitoring and reporting the status of these systems can only really be considered as a sufficient alternative to physical redundancy if the result is prompt notification and remediation which minimizes the exposure to and consequence of this failed component. Most new Protection Systems deployed in the industry include communication-aided protection with component and communication failure alarms monitored at centralized Control Centers. Therefore, this requirement is more applicable to legacy systems that need communication-aided Protection Systems to meet performance requirements of the TPL standards.

Clarification: Why are DC supplies addressed?

The SDT adopted the fundamental principles of the SPCS/SAMS recommendations regarding station Protection System DC supply. Failure of a single station Protection System DC supply is a significant point of failure as it will prevent the operation of all local protection, including back-up protection. The SDT partly modified the SPCS/SAMS recommendation regarding single station DC supply, including removal of the specific requirement that reporting the detection of an abnormal condition to a location where corrective action can be initiated must occur within 24 hrs. This modification recognizes the wide variety of reporting and monitoring that exists. However, it remains the intention of Footnote 13c, that monitoring and reporting the status of the DC supply can only really be considered as a sufficient alternative to physical redundancy if the result is prompt notification and remediation which minimizes the exposure to and consequence of DC supply failure. Similar to as noted with communication-aided Protection Systems, most new Protection Systems include DC supply status alarms which are monitored at centralized Control Centers; however, they may not necessarily be monitored for both low voltage and open circuit. Therefore, this requirement may be more applicable to legacy systems.

Clarification: What differentiates a single station DC supply (Footnote 13c) from a single control circuitry (Footnote 13d)?

The station DC supply includes station battery, battery chargers and non-battery-based dc supply, as enumerated in the NERC Glossary of Terms definition of Protection System. The control circuitry includes everything from where the station DC supply terminates through and including the trip coils, including the wiring, as well as auxiliary and lockout relays. Further, the NERC Technical Paper *"Protection System Reliability Redundancy of Protection System Elements"* (November 2008) shows a demarcation between DC supply and the remainder of DC control circuitry. The SAMS and SPCS report and recommendations align with Figure 5-12 from this technical paper, shown below as Figure 3.

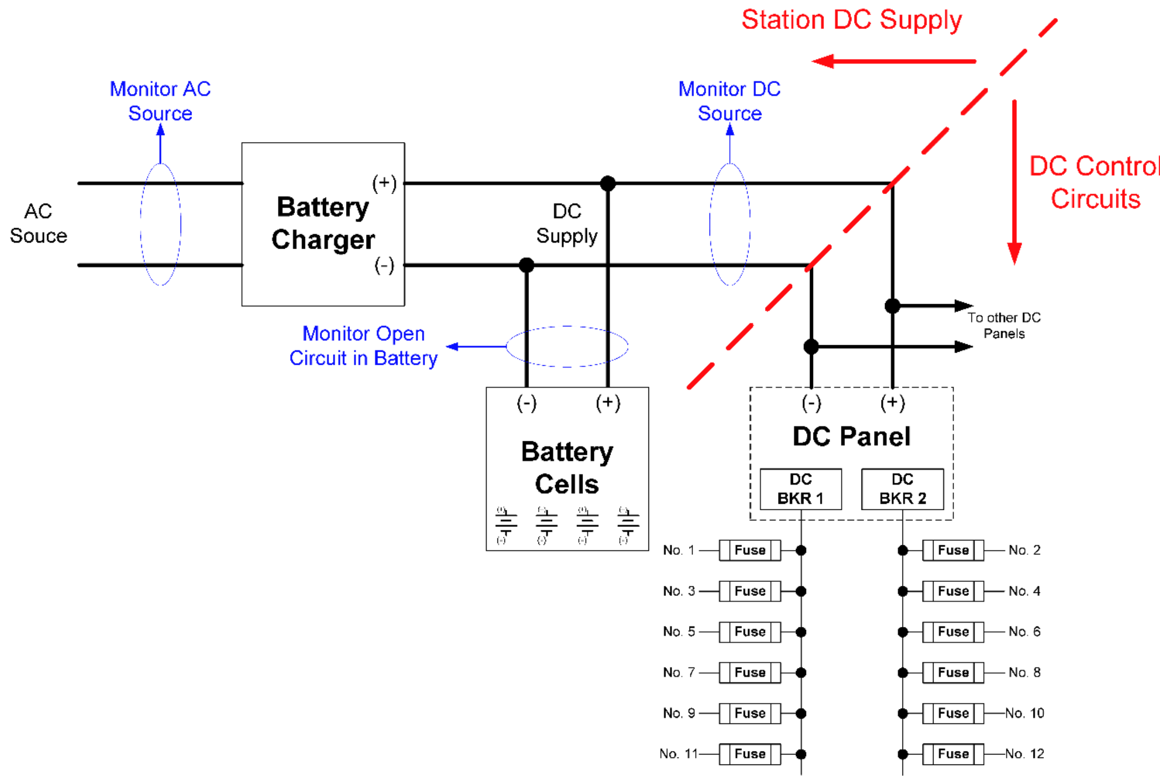

Figure 3 – Station DC supply and monitoring (Figure 5-2, from NERC Technical Paper "Protection System Reliability Redundancy of Protection System Elements", Nov 2008)

Simply monitoring for low voltage on the DC supply may omit situations where the DC supply voltage is satisfactory but the source path to DC control circuits may be open circuited. Thus, monitoring for low voltage and open circuit of the DC supply should be considered. Additionally, while the wiring in both the DC supply and the DC circuit have lower probabilities of failure as compared to other Protection System components, the SPCS and SAMS report identified this as a SPF risk.

Clarification: Is a battery charging system appropriate redundancy for the battery?

Battery chargers may not be of sufficient power to source current necessary to operate one or more breakers. For example, it is unlikely that a battery charger without a station battery in parallel would be capable of opening several breakers when demanded by a bus differential Protection System operation. Therefore, a battery charger cannot take the place of a redundant battery DC supply.

Clarification: Why is control circuitry addressed?

The SDT adopted the fundamental principles of the SPCS/SAMS recommendations regarding Protection System DC control circuitry. Failure of a Protection System single control circuitry is a significant point of failure as it will prevent proper tripping and, depending upon its design and mode of failure, may also prevent the initiation of breaker failure protection. Breaker failure is addressed by the Table 1 Planning Event P4 and is discussed in the next section. Further, most, if not all, constituent parts of the control circuitry are generally unmonitored, may fail, and may remain undetected until periodic testing is conducted. This is particularly significant for non-redundant auxiliary relays or lockout relays within the control circuitry because they may be used for multiple functions, such as multiplexing trip signals for differential or breaker failure initiation. Single control circuitry should be considered a non-redundant component of a Protection System given that Delayed Fault Clearing, including significantly delayed remote end or backup clearing, is expected when the non-redundant auxiliary or lockout relay device within the single control circuitry fails.

The single control circuitry is demarcated from the DC supply through and including the trip coil(s) for the purpose of including all devices in the control circuitry which, if failed, may prevent proper Protection System action leading to Delayed Fault Clearing. Trip coils are commonly employed in pairs (dual) for the purpose of incorporating redundancy to actuate the tripping of a circuit breaker or other interrupting device. However, the SDT partly modified the SPCS/SAMS recommendation regarding single control circuitry recognizing that some Protection System designs include a single trip instead of dual trip coils. When a single trip coil is employed, monitoring and reporting the status of the single trip coil can be considered as a sufficient alternative to its physical redundancy given that prompt notification and remediation is expected which minimizes the risk the trip coil failure. However, the trip coil(s), whether implemented singly or in pairs, are only part of the single control circuit; all its constituent parts should be included when considering whether the single control circuit may be a non-redundant component of a Protection System.

The Distinction between Category P4 and Category P5 Planning Events

"Table 1 – Steady State and Stability Performance Planning Events," makes a clear distinction between breaker failure, Category P4 Planning Events, and failure of a non-redundant component of a Protection System, Category P5 Planning Events. The sequence and timing of Protection System action leading to Delayed Fault Clearing may be quite different between the two fundamentally different causalities. Category P4 events involving the failure specifically of a circuit breaker assume that only the circuit breaker has failed, and that all other protection functions, including proper initiation of local breaker failure operation, has occurred correctly. For Category P5 Planning Events, failure of the various non-redundant components of a Protection System, as enumerated in Table 1, Footnote 13, can result in a relatively broader range of final system states, resulting from the Delayed Fault Clearing associated with the specific SPF, and which may or may not resemble the system states resulting from Delayed Fault Clearing associated with circuit breaker failure. Likewise, the Delayed Fault Clearing time that results from a Category P5 Event may be significantly longer that that expected when simulating Category P4 Event.

It is noted that there may be many instances where a fault followed by a breaker failure results in the exact same study simulations as a fault followed by a failure of a non-redundant component of a Protection System. There could be slight differences in clearing times and the Planning Coordinator or Transmission Planner may choose to simulate a P4 and P5 as one study using the longest expected clearing time. However**,** in the event of a bus fault followed by a bus differential protection failure, there may be a single relay (ANSI device 86) communicating to several breakers attached to the faulted bus. A bus fault on a breaker and a half configuration or double breaker double bus configuration may be particularly problematic in this case. For the Category P5 Event simulating this type of Protection System failure, none of the breakers which should open to clear the fault will receive the appropriate signal from the failed SPF relay and will not clear the bus fault. This makes the bus differential P5 Event significantly more severe than the P4 Event. The FERC Order 754 Section 1600 Data Request was specific to bus faults followed by a SPF of the Protection System.

In some cases, a P4 Event simulation at a specific location will be the same as the P5 Event simulation. For example: the failure of a control circuitry associated with a breaker trip coil results in the same analysis as the P4 for the breaker failing to open to clear a fault. Therefore, the P4 Event and the P5 Event may simulate the identical causality. However, if this simulation results in a performance requirement violation, the CAP must include mitigations for the P4 Event as well the P5 Event.

Extreme Events 2e-2h listed from the stability column of Table 1

Analysis of the data collected under the FERC Order No. 754 Section 1600 Data Request demonstrates the existence of a reliability risk associated with SPF in Protection Systems. Further, while the analysis shows that the risk from SPF is not an endemic problem and instances of SPF exposure are lower on higher voltage systems, the risk is sufficient to warrant further consideration. Risk-based assessment should be used to identify Protection Systems of concern (i.e., locations on the BES where there is a susceptibility to cascading if a Protection System component SPF exists). Given the risk to BES reliability, additional emphasis should be placed on assessment of three-phase faults involving a SPF on the Protection System. This concern, made manifest through the study of a three-phase fault and a SPF on a Protection System, is appropriately addressed as an extreme event in TPL-001-5, Requirement R4, Part 4.2. While less probable than SLG faults, three-phase faults frequently initiate as single-phase-to-ground with Delayed Fault Clearing and often evolve into three-phase faults, leading to Delayed Fault Clearing scenarios more severe than the Table 1, Category P5 Event. TPL-001-5, Requirement R4, Part 4.2, specifies that an evaluation of possible mitigating actions be conducted if analysis concludes there is cascading caused by the occurrence of extreme events. Thus, the SDT has maintained the three-phase-fault given a Protection System component SPF as an extreme event, but encourages consideration of implementing mitigating actions if it is cost-effective to do so.

Requirement R3, Parts 3.2 and 3.5 and Requirement R4, Parts 4.2 and 4.5

The SDT proposes non-substantive editorial changes to combine part of Requirement R3, Part 3.5 with Requirement R3, Part 3.2. The rearrangement of Requirement 3, Parts 3.2 and 3.5 were done to improve consistency within the Standard and do not create any new requirements. This is also true for Requirement R4, Part 4.2 and 4.5. However, it should be noted that the evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the (extreme) event is intended to support and encourage the implementation of reasonable, cost-effective measures to lessen the risk or severity of these events.

Section 2: FERC Order No. 786 Directives

Background

In addition to addressing reliability issues involving SPF on Protection Systems, proposed Reliability Standard TPL-001-5 revises the TPL-001 standard to address two directives from FERC Order No. 786.

FERC Order No. 786 P. 40: Maintenance outages in the Planning Horizon

FERC Order No. 786, Paragraph 40 directs NERC to modify Reliability Standard TPL-001-4 to address the concern that the six month threshold could exclude planned maintenance outages of significant facilities from future planning assessments. Order No. 786 provides the following considerations:

- Planned maintenance outages less than six months may result in impacts during peak and off-peak periods;
- Planned outages during those times should be considered to allow for a single element to be taken out of service without compromising the ability to meet demand;
- Criticality of elements taken out for maintenance could result in N-1 outage and loss of non-consequential load or impact to reliability;
- Planned outages are not "hypothetical outages" and should not be treated as multiple contingencies in the planning standard (should be addressed in N-0 base case);
- Relying on Category P3 and P6 is not sufficient and does not cover maintenance outages;
- The Near-Term Transmission Planning Horizon requires annual assessments using Year One or year two and year five. Known planned facility outages of less than six months should be addressed so long as their planned start times and durations may be anticipated as occurring for some period of time during the planning time horizon.

NERC SAMS Whitepaper Recommendations

To address this directive, the NERC SAMS recommended modifications to NERC Reliability Standards IRO-017-1 and TPL-001-4. The SAMS recommended that IRO-017-1 be used as the vehicle to assure that all types of known scheduled outages are being reviewed and coordinated to mitigate reliability impact as the most cost-effective means to address the intent of the NERC directive. The NERC SAMS also recommended modifying TPL-001-4, Requirement R1, Part 1.1.2 by removing "with duration of at least six months" and adding language referencing the outage coordination process developed in IRO-017-1, Requirement R1 as described above.

To understand the relationship between outage coordination and Transmission Planning Assessments, and how those relate to the FERC Order No. 786 directive and the current state of NERC Reliability Standards, SAMS considered the following:

- The duration of planned maintenance and construction outages can range from hours to many months or years. The impact that these outages can have on reliable operation of the BPS are irrespective of the duration of these outages, depending on many factors.
- Longer-term assessment of short-term outages or even longer-term outages is often considered an "academic exercise" due to concurrent outages, outage coordination practices and procedures, outage rescheduling and redesign, and alternative outage methods.
- The directives in FERC Order No. 786 pre-date the development of IRO-017-1, which was developed specifically to recognize the importance of outage coordination.
- Regional differences result in different outage coordination methods and procedures.

Revisions to TPL-001-4

Requirement R2, Parts 2.1.4 and 2.4.4

The SDT gave due consideration to the NERC SAMS recommendations and to a range of opinions and options regarding how to determine which known outages to include in the Near-Term Planning Assessment, which included varying, and sometimes conflicting, perspectives, such as that:

- the RC should not be consulted or involved at all in Planning Assessments,
- it is reasonable, appropriate, and efficient to consult with the RC,
- IRO-017 is adequate and applicable as it exists or with some modification, or
- maintenance outage selection for planning purposes should be at the sole discretion of the Transmission Planner or Planning Coordinator.

The range of these options reflects, in part, the substantial regional differences in outage coordination methods and procedures to address these types of outages. Those differences contribute to a legitimate difficulty in designing a reasonable and cost-effective continent wide means of addressing the FERC directive. However, FERC Order No. 786 requires that the issue be addressed. The rationale for selecting the known outages to be studied must be well thought out and available. The proposed modification is for consideration of known outages beyond, and therefore outside of, the Operations Planning time horizon.

The most prominent change the SDT proposes to address the FERC directive was to migrate the assessment of known outages from Requirement R1, which requires that System models shall represent, to Requirement R2, Parts 2.1 and 2.4 which requires how analyses shall be assessed and supported by studies. The SDT believed that this proposed change to where the assessment of known outages is specified in the TPL-001-5 requirements better aligns the approach necessary for the planning entities to execute their annual Planning Assessments.

The SDT modified Requirement R2, Part 2.1.4 and 2.4.4 consistent with FERC's directive, eliminating the specified six month outage duration and recognizing the various means that Planning Coordinators and Transmission Planners currently employ to consider the maintenance outages of concern, while meeting the requirements of Order No. 786. The proposed modifications place limitations on the known outages that need to be considered. The Planning Coordinator and Transmission Planner must have either a documented outage coordination procedure or technical rationale to select which known outages shall be assessed. The documented outage coordination procedure is intended to include consultation with the affected Reliability Coordinator, consultation with Transmission and/or Generator Owner(s) affected by the known outage, or application of documented outage coordination processes. The technical rationale is intended to include well-reasoned technical bases for making the determination. Consistent with the intention of Order No. 786, the SDT included the specification that the limitation of known outages to be modeled cannot be based solely on the outage duration. However, the presence of other accompanying factors, which in conjunction with outage duration, may form a reasonable basis for supporting that the known outage need not be assessed. It is only necessary to consider known outages expected to cause more severe System impacts, such as those that may result in Non-Consequential Load Loss for P1 event in Table 1. This allows the Planning Coordinator and Transmission Planner to use applicable means to assess which known outages are significant and prevents the need for conducting unnecessary assessment of outages which the Planning Coordinator and Transmission Planner do not expect to be problematic. The System conditions, such as peak or Off-Peak, that are expected during the period when the known outage is planned further limits the "non-hypothetical" analyses that may be performed. While it is inappropriate to assume that all known outages simulated in conjunction with Category P0 or P1 Events are identical to Category P3 or P6 Events, past or current studies may support the selection of known outage(s), if the study(s) has comparable post-Contingency System conditions and configuration such as those following P3 or P6 category events in Table 1 . However, it is imperative for the Planning Coordinator or Transmission Planner to document the justification for

supporting the known outage exclusion based upon past or current studies and why the post-Contingency System conditions and configuration are comparable in their technical rationale.

Clarification: Does TPL-001-5 duplicate requirements of IRO-017-1 for outage coordination?

The SDT was concerned that in order for the Planning Coordinator and Transmission Planner to jointly develop solutions with its respective Reliability Coordinator(s) for identified issues or conflicts with planned outages in its Planning Assessment for the Near-Term Transmission Planning Horizon, it must first assess the known outages as part of that Planning Assessment. However, if the Planning Coordinator or Transmission Planner does not know what outages to study, clearly outages may be omitted from having the opportunity for jointly developed solutions with the Reliability Coordinator, required in IRO-017-1. The SDT believed that the feedback loop between the planning entities and the Reliability Coordinator ends with the planning entities presenting their study results in the Planning Assessment, but must begin with strong collaboration and sourcing of information regarding known outages that should be studied beyond the Operations Horizon by the Reliability Coordinator. Therefore, the SDT does not believe that there is duplication between the proposed TPL-001-5 and IRO-017-1 standards. Moreover, the SDT believes there is an implied need to strengthen the collaboration and consultation between the Reliability Coordinator and the planning entities at the outset of determining the known outages that should be assessed in the Near-Term Transmission Planning Horizon.

FERC Order No. 786 P 89: Dynamic assessment of outages of critical long lead time equipment

In paragraph 89 of Order No. 786, FERC stated:

> The spare equipment strategy for steady state analysis under Reliability Standard TPL-001-4, Requirement R2, Part 2.1.5 requires that steady state studies be performed for the P0, P1 and P2 categories identified in Table 1 with the conditions that the system is expected to experience during the possible unavailability of the long lead time equipment. The Commission believes that a similar spare equipment strategy for stability analysis should exist that requires studies to be performed for P0, P1 and P2 categories with the conditions that the system is expected to experience during the possible unavailability of the long lead time equipment.

FERC did not direct a change but did direct NERC to consider this issue upon the next review cycle of TPL-001-4. The Project 2015-10 Standard Authorization Request included this issue within the scope of this project.

Clarification: Does TPL-001-5 prescribe an entity's spare equipment strategy?

No. The SDT addressed the guidance in paragraph 89 of Order No. 786 regarding stability analysis to assess System performance for conditions expected during possible unavailability of long lead time equipment in TPL-001-5 Requirement R2, Part R2.4.5. The SDT recognized that "spare equipment strategy" is not a NERC-defined term and believed it was sufficient to allow flexibility for applicable entities to conduct both steady state and stability analysis required by TPL-001-5 Requirement R2, Parts R2.1.5 and R2.4.5. For example, an entity's spare equipment strategy may include the warehousing of a replacement transformer to be installed given the failure of an in-service BES transformer. When an entity's spare equipment strategy may prevent major Transmission equipment from being out-of-service for one year or more, this possible equipment unavailability need not be assessed as part of TPL-001-5 Requirement R2, Parts R2.1.5 and R2.4.5.

NERC SAMS Whitepaper Recommendations

The NERC SAMS considered the following key points related to FERC's Paragraph 89 guidance:

- Removal of Elements in the Planning Assessment for spare equipment strategy is only applicable for those Elements that have “a lead time of one year or more.”
- Each long-lead time Element that is removed from service creates a new operating condition considered the “normal” (P0) condition for Table 1. The applicable contingencies will be studied with that Element removed from service in the pre-contingency state for stability analysis. For example, if a long-lead time transformer does not have a spare, it would be studied as a P1.3 event. Since P0 does not include an Event, P0 does not and should not be included in the stability analysis section for long-lead time Elements not included as part of a spare equipment strategy.
- System adjustments may need to be made to the power flow base case to accurately reflect reasonable and expected operating conditions with that Element removed from service in the pre-contingency (P0) operating state.
- TPL-001-4, Requirement R4, Part4.1.1, related to P1 Events, requires that no generating unit pull out of synchronism. The outage of a long-lead time Element followed by a P1 contingency should not result in a generating unit losing synchronism.
- TPL-001-4, Requirement R4, Part 4.1.2, related to P2 Events, allows for generating units to pull out of synchronism. The outage of a long-lead time Element followed by a P2 contingency should not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities.

The NERC SAMS white paper contains the flowing recommendations for stability analysis for long lead time Elements not included as part of a spare equipment strategy:

- The outage of long lead time Elements has an equally important impact from a stability standpoint as it does from a steady-state standpoint.
- The Planning Coordinator and Transmission Planner must demonstrate that they have met the TPL-001-4 performance criteria for specified contingency events and contingency combinations thereof as per Table 1. This should include long lead time outages that can occur for equipment that does not have a spare equipment strategy.
- TPL-001-4, Requirement R4, Part4.1.1 requires that no generating unit pull out of synchronism, while R4.1.2 allows for generating units to pull out of synchronism so long as the resulting instability does not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities. The outage of a long lead time Element followed by a P1 contingency should not result in a generating unit losing synchronism.
- While the P2 contingency allows for individual generating unit instability, the Transmission Planner and Planning Coordinator must ensure that this instability does not result in tripping of any Transmission System Elements other than the generating unit and its directly connected Facilities and therefore should include P2 contingencies event.

Revisions to TPL-001-4

Requirement R2, Part 2.4.5

Consistent with FERC’s Order No. 786 guidance and the SAMS recommendations, the Project 2015-10 SDT revised TPL-001-4 Requirement R2, Part 2.4.5 to add a similar requirement for stability analysis. The change to Requirement R2, Part 2.4.5, which includes similar language to that used for the steady-state analysis under Requirement R2, Part 2.1.5, adds clarity that the outage of long lead time Elements has an equally important impact from a stability standpoint as it does from a steady-state standpoint and should be assessed commensurate with an entity’s spare equipment strategy.

Section 3: Applicability

The requirements remain applicable to the Planning Coordinator and Transmission Planner. Coordination and cooperation between operating and planning entities in concert with asset owners will be required to implement the standard requirements. The planning entities and System Protection personnel that will need to collaborate when conducting the studies and submitting the data may be working for different companies or business units, and time will be required to accommodate the development of processes and data flow that cross company or business unit lines. Coordination with Generator Owners, Transmission Owners, and Distribution Providers will be necessary to evaluate the Protection System(s) for locations on the system where a failure of a non-redundant component of a Protection System could result in a potential reliability risk. Transmission Planners and Planning Coordinators must obtain this information, as well as resulting fault clearing times, to perform proper studies.

Standards Announcement

Project 2015-10 Single Points of Failure

Final Ballots Open through October 22, 2018

Now Available

Final ballots for **TPL-001-5 – Transmission System Planning Performance Requirements** and the **implementation plan,** are open through **8 p.m. Eastern, Monday, October 22, 2018**.

Balloting

In the final ballot, votes are counted by exception. Votes from the previous ballot are automatically carried over in the final ballot. Only members of the applicable ballot pools can cast a vote. Ballot pool members who previously voted have the option to change their vote in the final ballot. Ballot pool members who did not cast a vote during the previous ballot can vote in the final ballot.

Members of the ballot pool associated with this project can log in and submit their votes here. If you experience issues navigating the Standards Balloting & Commenting System (SBS), contact Wendy Muller.

- *If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The voting results will be posted and announced after the ballots close. If approved, the standard and implementation plan will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Latrice Harkness (via email) or at (404) 446-9728.
